From: kevan@empyr.dircon.co.uk
Message-ID: <10101994.184849@empyr.dircon.co.uk>
Source record: 29950

Hi All,

I'm not sure if this is the right area, but......

I have been trying to exchange some synthesiser data banks with a few
friends via e-mail. They are uuencoding their file, and sending it to
me. I have the ESS en/decoder prog v6 running on my ST, and whilst it
gets *a* file with the correct name out of the e-mail, it is completely
wrong as far as the data content is concerned. I have tried uudecode,
ship decode, mime decode and I *still* get the same rubbish out.
It cannot be the senders fault, as *two* people have sent me data, and
the same thing happens to both.

I know the data is correct before they encode it. I think it must be
something to do with my decoding somewhere. Has anyone had any similar
problems ? I've even tried a UUdecoding prog on the PC in the office,
and I *still* get the same rubbish. Could it be my BBS stripping
characters out or something ?

Please e-mail me if you have any suggestions.

Thanks.

Zilog published a technical reference manual which is a must for any programmer
wanting to use the SCC.
I think it is now published by AMD. Ask your local AMD/Zilog representative.

PLEASE PLEASE.

Can some of the people that manage these Atari Archive sites,
Please have a file extension standards or fix up your Gopher servers...

THIS IS A BIG PROBLEM FOR PEOPLE WITH GOPHER CLIENTS...

THERE ARE ONLY 3, YES THREE ATARI ARCHIVE SITES WITH GOPHER SERVERS
THAT WILL EXCEPT ATARI FILE EXTENSIONS, that I know of...

Atari Archive..
TU-BERLIN
HENSA...

Only these sites support Atari file Extensions...

Some one at uni-kl.de was going to fix there Gopher client, but that was
months ago, I just tried to get a file with a .lha extension, this is not
supported, or any other Atari specific extensions...

Come on you Admin People if you are going to allow any kind of File Extensions,
please make sure that these files can be recieved from your Gopher client...

So PLEASE Fix up your File Standards or your Gopher Clients.....

THANKS.....!!!!

Message-ID: <42332e9a6e83@sirius.herts.ac.uk>
Source record: 29963

Request for ideas (Forthcoming Project!)

File Searching tool:

I have to implement the following program for my final BSc Computer Studies year assignment.

The program is aimed to run primarily on Atari ST/Megas/TT and Falcon machines. So far I have the following ideas:

Core Objectives

1. Implement file searching on the following criteria:

Types of file
(Read Only, system, hidden, archive, program flags etc.)

Extensions
Unix type or DOS type wildcards for filenames.

Dates
Date/Time stamps of created files.

Sizes
Files greater, lower than given file sizes.

2. Once those file(s) have been found from the above criteria, implement the following actions:

Deletion of file(s) and/or

Information on file(s)

Output to screen, printer or file
Selectable output Types of file, Extensions, Dates, Sizes (see section 1 for description)

3. Design the program to be implemented in a modular manor, and highlight easier modification for different file systems.

4. Implement program.

5. Design of user interface.

6. Implementation of user interface on Atari through GEM.

7. Write documentation/help files for finished program.

Advanced Objectives

1. Research and possible implementation in directly accessing the disk system rather than using BIOS routines. (built in system routines)

2. Research and possible implementation into searching through archived files. (ZIP, LZH, ARJ?)

3. Implementation of algorithms for searching text within files.

4. Research into how to make the program more modular to be easier to incorporate on a different system (e.g. IBM PC Compatibles)

Any further additions or modifications on existing ideas would be greatfully received. Even if you think the above ideas are OK please email me :)

>& you have to get the formatting/editing/utilities somewhere else?

With HDDRIVER you get a tool for partitioning drives, for parking drives
after a certain time (this also works with other XHDI compatible) software
and a program/CPX to enable write protection on certain drive. There is no
software included for formatting drives. But with all current drives this is
not necessary because they all are preformatted, i. e. partitioning is all
you need to do.

3 solutions:

1) Install NVDI
2) Get the latest Mint kernel, it is *much* faster than v1.04.
3) Use a faster shell (eg tcsh)

5291. Producing a caret in editing windows

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-11 14:46:19 UTC
From: rrt1001@cus.cam.ac.uk
Message-ID: <37e8fr$m62@lyra.csx.cam.ac.uk>
Source record: 29971

How does one produce the standard thin caret (as seen in dialogues) in an editing window? Or any cursor, for that matter? There are several methods I can think of, but I was wondering if there is any standard manner for producing the exact caret used in dialogues (as used in, e.g. Prospero C). I can't see any system calls that seem to do this specifically.

5293. Problems upgrading 520st-fm memory?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-11 16:58:28 UTC
From: rjt2@bnr.co.uk
Message-ID: <37eg7kINN7fn@bhars12c.bnr.co.uk>
Source record: 29893

(This is no doubt answered in a FAQ somewhere - if so a pointer, rather than a flame would be appreciated :-)

I'm considering buying a friend's 520st-fm purely for MIDI sequencing.
I would want to upgrade the memory immediately to 1M or more. From what I gather this means soldering in 16 "41256" 256x1 D-RAMs for upgrade to 1M.
After talking to one distributor I gather that many companies have now made this part obsolete/discontinued.

Q1: Any recommendations of whether it is generally difficult to get the said upgrade, and where (in the UK) people would recommend? Approx cost?

Q2: How easy/expensive would it be to upgrade to 2M or 4M instead?

All constructive advice appreciated!

Richard.

I cannot answer this question, but I am wondering how you plan to upgrade.
4.04 is the only release version of TOS, anything below that is on developer
only machines. I';ve got one with 4.02 and Atari themselves didn't seem too
willing to sell me a new ROM.

Just about everything runs faster in 16 color mode. Have you also tried
MiniWin, the program that ships with MultiTOS? I think it is a bit quicker.

5299. Help with global array.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-11 17:40:46 UTC
From: hopper_t@msupa.pa.msu.edu
Message-ID: <37eimu$12o0@msuinfo.cl.msu.edu>
Source record: 29974

Hello, all,

I was looking through my Atari Compendium, and noticed that the appl_inti() function is supposed to fill in an application's global array with several peices of info, notably the AES version number (in global[0]). My question is: how do you access this global array with GNU C?

For that matter, what other methods are there of determining such things as AES version, GEM version, etc.?

Finally, is there any documentation for GNU C that talks about things like the global array? I have the documentation that explains compiler commands, but that seems to miss a few important parts of programming on the ST.

Thanks,
Tom

I saw lots of adverts when the falcons started being sold which had 4.01
and 4.02.
(no 4.03 though....)
The one I bought has 4.04.
From what I have heard 4.01 and 4.02 seem to have lots of bugs in them
(which may well be true if they are not supposed to be release versions...)

I've *seen* both though own neither. The Tower is fairly basic by PC standards - and quite expensive. There is not a lot of other opions though - unless you fancy squeezing your ST into a PC tower case.

I wouldn't buy a Tower unless I seriously needed it. The only reason I can think of for getting one is a PAK3/33 accelerator card. A Tower costs around 200ukp and most people can find a better use for this money.

The DeskTopper is simple and much cheaper. I would have thought it was more suitable for an STFM than the tower.

> 2) Are there any other kits for transporting a 520stfm to a separate

Don't know of any.

> the trackball work on the ST).

Extreamly unlikely. (I'd say no - but I haven't *actually* tried)

> case. For that matter, will the ST innards fit inside a mega ste

No. The MSTE case is actually quite small compared to an STFM case.

In the alt.binaries.multimedia and alt.cd.(something) groups there is
talk about movies on CD-I disks in a 'standard' format compressed in MPEG.

I think the newer CD-I disks are in a ISO9660 format which Atari
computers can read but I don't know the file structure. Is the whole
movie in one file (eg. STARWARS.MPG) or is it broken into several files?

Perhaps PLAYMPEG will someday replace the PC's Reelmagic board. :)

>
> Q2: How easy/expensive would it be to upgrade to 2M or 4M instead?

I have just done an upgrade of a 520STFM to 2mb. It was the first low-low
level hardware thing I have ever done, and it worked fine. I'm working on
getting together my instructions, which I'll put on atari.archive.umich.edu.

I used two 1mb SIMMs, a 2-place SIMM socket, and wire-wrap stuff. There
are instructions on atari.archive.umich.edu that tell you how to do it
with 2 SIPPs (but I believe that my method is easier). I went to great
pains to give myself the best chance of pulling the upgrade off :-). I based
my version of the upgrade heavily on the SIPP version of the instructions.

It would be fairly easy to upgrade your 520STFM to 2mb, with a very high
chance of not having any problems. You could also upgrade it to a 2.5mb
or 4mb machine, but there is a lower chance of success (exactly why I believe
this to be true will be laid out in the instructions I am working on).

Hi Folks ,
I'm planning on getting an ICD SCSI card for my 1040ste.
What I'd like to attach is the following.

170MB SCSI Disk
1.4M SCSI Floppy Disk
150M SCSI Data Cartridge Tape Unit

My question is , does anybody know of or have software drivers
for the SCSI Floppy disk and the Tape unit. I seem to recall seeing a
scsi tape driver somewhere but I've not seen a Floppy driver.
On an ftp site perhaps?

Any help/advice appreciated.

Cheers,
David

> freeware one first

If you can't afford the TOS 2.06 switcher kit, go for TOS 1.4 and Neodesk 3.3,
so far Neodesk 4 has to many bugs..

With a replacement Tesktop you must have a Hard Drive, and a good Boot Util,
I use Xboot III but that would be to dear for you....

Some games work better with TOS 1.4 than the do with TOS 1.2, also
TOS 1.4 has many many bugs fixed...

Why do you want to buy an ICD card? Buy the Link or the Link2 instead.
By doing that you have the software included.

> By doing that you have the software included.

There is at least one advantage that the AdSCSI cards have over the Link(s): free software upgrades. The Link software must be upgraded directly by ICD. The AdSCSI/Advantage/Micro software can be downloaded from Genie, Compuserve, or the ICD BBS. Also, other ICD owners can often help you get the software updates. Both the Link and the AdSCSI come with all the software one might need, in this sense, BTW. Both the AdSCSI and Link2 support parity.

The main advantages of the Link are that it is external, and it can support floptical drives (bleech). The ability to plug any standard PC/Mac external SCSI drive without having to open it up is significant, but not overriding.

As for the original poster's question, the SCSI drive and 150mb tape are no problem, any of the ICD software versions (Pro, Link, standard) will support them. The SCSI floppy is another story. I have never heard of that one being done. You should probably contact ICD and ask them if they have tested such a thing. It could be that the Link's ability to do flopticals might also imply SCSI floppies, as I think one can stick HD floppies into a floptical.

Do be sure to check out the GEMar shareware tape software. Very good stuff.

This is the best possibility. TOS 2.06 employs an alternative mechanism:
It first tries to read the disk in the current density, then switches
to the other density. If both attempts fail, the disk is unreadable.

BTW, this behaviour is the only reason why TOS 2.06 is recommended
if you want to use HD disk drives. You can also work without it.
My Mega has TOS 1.04 and runs just fine with a hardware mod which
switches the clock rate automatically depending on the disk in
the drive.

Putting in extra 512K in no big job (if you have a good soldering iron,
and know how to solder electronics). I've upgrades lots of STFM's
(and many STM's - and that's real fun because there are no room for them)

In the UK, TOS 4.04 chips are available from System Solutions. Nice people!

Quite a lot of machines over here have been shipped with 4.02. In fact my
Falcon which I bought 3 months ago arrived at System Solutions with 4.02,
but they fitted 4.04 before they sent it out to me.

There aren't any speed improvements as far as I know, then main improvement
is that the 3D dialogs etc. work in this version

5327. AES bug/feature in form_alert

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-12 09:18:43 UTC
From: "S.J. Harrison" <S.J.Harrison@ncl.ac.uk>
Message-ID: <37g9lj$ncl@whitbeck.ncl.ac.uk>
Source record: 29907

I have repeatedly come across a problem with displaying forms immediately after selecting a menu item, such as an "About.." option. The call to form_alert seems to "hang" allowing mouse cursor movement but no alert box appears and no further operation is possible without resetting the machine. This occurs on a TOS1.62 STe machine. It seems that if a mouse button is held down when form_alert is called (such as when a menu item is selected), the machine crashes. Solution: wait for all mouse buttons to be released.

Is this a bug or known feature of all AES versions, and if so, is there a way around it? If any form_alert call will crash if a mouse button is down, should all form_alerts be preceeded by a wait for mouse button releases? Even this will not be 100% certain since mouse button bounce or pure chance could conceivably cause a depression just after the wait code. I have looked in various GEM/AES literature but have found no mention of mouse button state when calling form_alert.

Any comments appreciated.

Not true, I'm afraid - C is lower level and therefore potentially much
faster than either Pascal or GFA (especially interpreted GFA). But if you
don't write well optimised C code, then it could be slower.

John, I'm not sure, but it sounds like that version is for the TT030 and possibly the Falcon. If you're running on a 68000 processor, what you may need is TeraDesk 1.39.

From: Sole@EMBL-Hamburg.DE
Message-ID: <37h4b2$mdp@dscomsa.desy.de>
Source record: 29917

Hi,

I own an Atari STFM with 1Mb memory (sic) and I would like to work with it in a 3 to 4 Mb memory environment without spending a lot of money (it's difficult to justify a big investment on such machine).

I've read the 68010 is like a 68000 but it can support virtual memory. Does anybody know how one can take the 68010 advantages on an atari ST? Would be possible to run the Spectre emulator with it?

Do I have any other way ? -on the Macs with a 68030 the operative system takes care of virtual memory -

Thank you for your help.

Armando

I've upgraded mine from 4.2 to 4.4 and it costed me one stamp to
return TOS 4.2 :-)
This was because I had some problems with my communication with 2400
baud on some BBSes. TOS 4.4 doesn't solve this problem, but now I have
a new TOS!
BTW: is there a way to fix RTS/CTS on a Falcon? I mean: sometimes it
doesn't works right, although the port-configuration is OK...

I upgraded my 520STFM to 2.5 megs 2 years ago with Frontier (now Marpet)
Xtra-Ram DeLuxe.

If you feel competant I suggest you find out what sort of MMU
(surface mounted or socketed, square or rectangular) before you
order so you get the correct MMU adaptor straight away. I didn't have
any problem with the shifter, although a socketed shifter is no doubt
less trouble.

This upgrade lets you use stardard SImms (up to 4 MB).

I'm not in touch with current pricing or other developments, but I
have heard you can get more than 4megs in an ST nowadays.

The only problem I have (once installed correctly) is I occasionally
have to tighten the earth lead screw (I'll solder it one of these days).

I upgraded my 520STFM to 2.5 megs 2 years ago with Frontier (now Marpet) Xtra-Ram DeLuxe.

If you feel competant I suggest you find out what sort of MMU (surface mounted or socketed, square or rectangular) before you order so you get the correct MMU adaptor straight away. I didn't have any problem with the shifter, although a socketed shifter is no doubt less trouble.

This upgrade lets you use stardard SImms (up to 4 MB).

I'm not in touch with current pricing or other developments, but I have heard you can get more than 4megs in an ST nowadays.

The only problem I have (once installed correctly) is I occasionally have to tighten the earth lead screw (I'll solder it one of these days).

Im curious about this. Ive had 100% better performance out of my
Falcon at 14.4k than a PC (8250 UART) at the same speed. I am
always getting CRC errors on the PC, but downloading the SAME file,
from the SAME system, at the SAME speed, I get no errors, or at the
most one. (I realize that I should prolly get a 16550 for the PC,
but I dont really care, I want to get rid of it anyway: anyone
wanna trade a nice 486 for a TT? :-)

Okay - what is it based on? ;-)

I was under the impression that some of the freeware BSD had made it into
Linux (in fact a *lot* of it), and that this freeware BSD was something
to do with the standard BSD 4.3.

Its not SYS V, or (hopefully not V7?) :-(

Thanks

Roland.

Well you don't *actually* need ExtenaDOS. I'm using the ICD .XFS driver
which comes with the Pro utilities. If you have to buy a host adaptor
anyway - then I believe the ICD Link (2) ones come with a version of this
also.

OTOH point taken. CD-ROMs can quickly get expensive. Mine's cost 185ukp plus
the CDs I've bought for it.

:-)

Don't rely on any of the free ones unless you know somebody who had got them working. On my TT and MSTE I've had varying success with them. Good enough not to bother buying ExtendaDOS yet. I bought the ICD Pro Uiltities (before Extenados was released) but the CD-ROM driver is only so-so.

If you are building your own CD-ROM system - then my advice is to get the hardware and play with the free software. If you can't get it to work - then fork out for the commercial stuff. You might save some money that way - and you'll definatley learn a bit about SCSI.

:-)

Roland.

5354. Setting SCSI ID of a Digital HD

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-12 23:39:00 UTC
From: gert@ttgk.textlitho.nl
Message-ID: <Up-EJNAAJUU@ttgk.textlitho.nl>
Source record: 29791

Hi,

Does anyone know how to adjust the SCSI ID of a Digital RZ28-E harddisk ?
On the PCB of the drive are 6 jumper pins arranged in 3 rows of 2 pins,
normally this kind of arrangement implies the 1-2-4 SCSI ID setting, but
whatever combination I set (the drive came without jumpers on these pins),
the drive keeps 'being' ID 0 and runs as if nothing changed.

As the drive is not starting up on itself (spindle motor doesn't start on
power up, only after being 'asked' by the Hushi driver software...) I would
like to set the ID to anything other than 0 so my 'old' SCSI drive could
boot up the HD driver and then start up the Digital. Booting from floppy
goes OK but I had to set my old drive to ID 1 to get things running.

The drive identified as SCSI-2 with the SCSI tools from Hushi, maybe this
will help a bit..

Could the drive be 'programmable' ? It does contain an EEPROM 28C64.

Gert

P.S. I forgot to mention, the drive is connected to the SCSI port of my TT.

>Okay - what is it based on? ;-)

It's not `based on' anything in that sense. The Linux kernel is completely new code developed by Linus Torvalds. The utilities and applications that usually come with it are generally software from FSF/GNU, Free BSD, etc. in the same way that the MiNT kernel is wholly developed by Atari/ERS but uses these utilities.

>I was under the impression that some of the freeware BSD had made it into
>Linux (in fact a *lot* of it), and that this freeware BSD was something
>to do with the standard BSD 4.3.

You're thinking of FreeBSD, which is a `competitor' of Linux.

>Its not SYS V, or (hopefully not V7?) :-(

It's behaviour is actually a composition of the behaviours of many Unix variants. It is Posix compliant (as MiNT aims to be). In general, I find that Unix sources compile more reliably under Linux than under Solaris 2 on a Sun.

The reason for this is that if a problem occurs with a compilation under Linux, *the users* can produce a OS-level solution rather than hacking the software to make it conform to idiosyncrasies of Linux, whereas on a Sun, Sun Microsystems provides the OS and whatever idiosyncrasies it has, youy just have to put up with.

It was none other than Kevan Winch that wrote on 08 Oct 94 that ,
KW> could buy TOS 1.4 roms, or go the whole hog and get the 2.06 switcher
KW> kit, but that's a bit too expensive !

But TOS 2.06 is much more than just a 'replacement desktop bolted onto TOS1.xx
. My opinion is that TOS2.06 is by miles the best bet for you
if you can afford it .... I never regretted that outlay. Some games don't like
it (mostly old ones) but it is so much more robust than any previous (And a few
later) TOS versions it is a joy to use .

The only alternative you didn;t mention and well worth considering is "TOS2.00"
(MagiCTOS) which replaces TOS completely with a highly
optimised Code and even if you don't have a need for Multitasking
you get a very fast single task environment ... it costs about the same
as TOS 2.06 but again is much more than a simple desk replacement .

If thats all you want (desk) then Terradesk is as good as any but you will
still need to patch up your TOS as it remains untouched.

Its compiler to include 68020 code not just 68000 instructions hense the
crashing. You need 1.39 (?).

5363. re teradesk 1.4

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-13 10:03:51 UTC
From: romuald@mendel
Message-ID: <37j0m7$87t@ujf-iab>
Source record: 29792

What I know on the subject !

Teradesk should work on both processor.
- teradesk.prg for 68000 and above
- tera020.prg for 68030 computer (TT falcon)

There is a problem with this version. 1.39 works fine, not this one
(I tried it on a STE 4Mo SM124)

I tried the french ressource (because I'm french and it dosen't work)
The only needed files are :
- an executable (teradesk.prg or tera_020.prg for lucky ones)
- the ressource file (teradesk.rsc or the terafra.rsc renamed in teradesk.rsc)
- the icons ressource file (icons.rsc I believe)

Hope this help. Any information on a working 1.4 version is welcomed :)

5364. Bootconf --- UNIX preference?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-13 10:04:50 UTC
From: sanders@sci.kun.nl
Message-ID: <CxLw03.LCG@sci.kun.nl>
Source record: 29793

Hi,

When playing around with Bootconf (by Uwe Seimet (?)) to set the
bootup resolution, I found a `preference' switch: `Keine' (none), `TOS'
or `UNIX'. I selected UNIX, but my Falcon wouldn't boot from HD
anymore. What is this switch for, anyway?

Thanks for any replies,
--

How exactly did you upgrade? Where did you send your old TOS to? I
bought a Falcon second hand, which contains TOS 4.02. Any chance I
can upgrade mine for one stamp, too, or do I have to buy the new ROMs?
If so, where?

Thanks for any replies,

Sander STOks

Hello.

I just bought a `Linux machine' (OK, it is a 486 but only 50 of the
540 megs are for DOS which I haven't got round to using yet :-), and
I was wondering if anyone out here has any experience connecting TOS
or MiNT with a Linux box.

I was hoping I could get as far as to mount (parts of) the Linux disk
to drive U:\ under MiNT using MiNTnet over a null modem cable. But
perhaps this suggestion is totally ludicrous as I haven't looked at
MiNTnet yet.

But just FTP would do fine as well, I guess :-)

:>Perhaps PLAYMPEG will someday replace the PC's Reelmagic board. :)

I've managed to get hold of some MPEGs on CD, that contain audio and video
data interleaved - be sure that one day PLAYMPEG will support this type of
MPEG stream. I'd imagine that a whole Movie would be a single stream, (to avoid) pauses
between file access.

Of course the very easiest way if you have Web access is to click on
'Desktops' in the ZFC Drive U pages. This will lead you to many FTP
sites offering Atari desktops, right into the directory .../desktops
or .../shells. The same holds for any other type of application.

Although we currently only support some 8 sites, we will add several
more this week. Anyway, most desktop replacements are already there.

AREA:COMP.SYS.ATARI.ST.TECH

From: coutu@mv.mv.com (Dan Coutu)

I've been following the discussion on MinixFS and BGM partitions over the past few weeks hoping for enlightenment on my problem. So far I've not found it and so I'll ask directly.

Back in August I got ICD's Link2. I already had a bare hard drive, power supply and some appropriate ribbon cable and connectors. I assembled a cable for myself with two Centronics 50-pin bulkhead connectors (the ones that mount onto your drive case) and a couple 50-pin IDC connectors for the drive connections. Rather than using terminating resistors on the drives I've got a terminator plug in one of the Centronics connectors and my Link2 in the other connector. I connected a 102Mb and 424Mb SCSI drive to the cable and have good luck in using them. All has formatted and partitioned fine.

Then I went looking for Mint since I now had both enough memory (4Mb) and disk space to make it worthwhile. My problem arose when I tried to setup Mint (using the defalt 0.95 distribution) with the Minix FS. I had tried to use a 224Mb partition on my large disk as my MinixFS partition. This is, naturally, a BGM partition. Well when I tried to startup Mint it simply locked up. I could do nothing with the file system. I had to settle for using Mint with a TOS file system in order to use the partition.

From what I've read over the past few weeks it seems that if I want to use a large partition for my Mint work I'll have use a TOS file system. If I want to use the MinixFS then I'll have to stay with partitions less than 32Mb. (I have TOS 1.4 BTW) My question to the net is this: is the above true? Are large file systems only a dream for me? Do I have choose between long filenames or big partitions? I certainly hope not. :-(

Thanks for any help you may be able to offer!

From: coutu@mv.mv.com (Dan Coutu)

I'm stumped by what appears to be a difficulty in starting up Mint.
Here's the story:

I normally use Geneva/NeoDesk4 as my working environment. After getting
some new disks I snarfed a ton of Mint related files and tried to setup
Mint on my system as well. I've ended up having to use Mint in a not
completely satisfactory way though.

I found that if I simply added the Mint program to my auto folder then
when Geneva started up NONE of my desk accessories loaded! I eventually
traced this to being a problem with the default directory. Mint would set
my default directory to the root directory of the Mint unified file
system (U:) and geneva wold then fail to find any files there! Even
changing my mint.cnf file to cd to my accessories directory did not
resolve things. The only difference that made was to allow NeoDesk to
then succeed at loading but still no accessories!

Because of this I pulled the mint.prg out of my auto folder and now run
it manually when I want to use Mint. I also setup the mint.cnf file so
that it starts tcsh for me. While this works fairly well and provides far
fewer crashes it seems to be throwing the advantages that Geneva coupled
with Mint should provide me by way of multi-tasking.

Any suggestions on how I can get Mint and Geneva to peacefully coexist
and still use my desk accessories?

My system config is: Stacy 4, 40Mb internal SCSI, 102 and 424Mb external
SCSI, TOS 1.4 with TOS patches, Foldr500.

I wasn't criticising you, but the things you were saying which
considering they were quite inaccurate wasn't so wrong of me.
When I realised you had purchased a Falcon all those months ago and were
coding for it I was really pleased that there were some fine coders on
the machine. And then when I approached you with the demo idea, the
one time I called upon your services, because I have always admired your
work on the ST (Decade demo etc.), you let me down completely and then
have the gaul to post messages like you did. It's like having a famous
hero/TV star who turns out to be a real git when you finally meet them or
something. And you expect me to be able to take your post in a light
hearted manner? Considering there were a few rather 'vital' details left
out I find that hard to do.

>anymore. What is this switch for, anyway?

This switch advises AHDI and some compatible drivers to look for a bootable
UNIX partition instead of a bootable TOS partition. If no UNIX partition, i.
e. no partition belonging to the Atari System V for the TT, is found, the
machine won't boot at all. So it is normal that after changing the switch to
UNIX your Falcon wouldn't boot any more. Set it back to None or TOS.

: doesn't works right, although the port-configuration is OK...

: Frits.

Yes, I have been using the Fast Serial Fix .96b. It fixes the RTS/CTS
and allows you to run up to 110,000 bps on the modem port.

Wel if you bothered looking into your own BBSs files, you would find
a newer version of mint compiled for 68000. It's the one that was
uploaded a month or so ago, and it IS compiled for 68000, not 68030!
It may be that it's a privat upload, but I guess you have access to those
:-)

Hi Kevan,

In reply to your message to everyone on 08 October 1994

KW> Hi, Can anyone tell me which of the desktop replacements are the best ?

I think BEST is up to you! I use Teradesk and find it very useful. I'm using
an STE with 4 Meg and Tos 1.62. It hasn't let me down and getting icons etc.
is easy as they are the same as uses in Tos 2.xx . I tried Gemini but couldn't
get it "right" and KaosDesk I gave up on pretty quick..
If I had the cash I'd probably get Tos 2.xx but I haven't at the mo so TeraDesk

does me nicely!!

Cheers .. Antony

does this mean that you have to have this step rate program in order to be
able to use the disk drive in HD mode? What a hassle. I'd like to just be
able to switch on the computer and read a HD disk, because I don't have a hard
disk, so auto programs etc. are a hassle- for now I'm using a "startup" disk
every time I use the computer.

1. It's easier to use someone else's library (code re-use).

2. It's faster to develop with someone else's library than to
develop your library, then the program (or the lib functions
as-you-need-them).

3. In a non-trivial program (ex, text editor), 60k is nothing. If
you're worried about 60k, you're still running off floppies.

Hi Stefan,

As Claus has already pointed out, you need to use the dip switches on the bottom of the Megafile 44's case. I believe that Dip Switch #2 is the one that you'll need to toggle. The system should be shut down when you flip the switch, and then re-boot the whole system.

I had a 60 meg Seagate installed in the case with my Megafile 44...quite a nice combo. Drop me a note in email if you still have problems, I think I have all the configs written on the bottom of my megafile 44. For you, I'll flip it over and read me notes. :)

regards,

Bob Brodie

I've sent a bug report to Steve Henson and a fix for it which should cure
your problem. I actually started this whole thread about MinixFs & BGM
partitions because I had the same problem as you when I upgraded to a
1Gb drive with 3 MinixFs partitions of around 350Mb each.

Steve hopes to have the patch incorporated in pl11 of MinixFs, to be
released when he has time. In the meantime, if you wish I can email you
my 'fixed' version of MinixFs to tide you over. It also has another fix
for a small bug which affects partitions using > 14 character filenames.

To anyone else listening: MinixFs6 pl10 will not work with partitions
greater than about 200Mb. I'm sure someone will pipe up and say their
system works fine, but all I can say is I'm amazed if it does.

Also, if you're MinixFs partitions can handle > 14 character filenames,
do not try to delete '..' !!!! You will royally screw-up your
filesystem with MinixFs6 pl10.! (fsck should be able to repair it, though
your affected directory _should_ end up in 'lost+found')

>From what I've read over the past few weeks it seems that if I want to
>use a large partition for my Mint work I'll have use a TOS file system.

Nope. My 3 big MinixFs partitions now work perfectly :)

Cheers, Steve

Just thought I'd give you all an update of my problem.
I'm not exactly sure what I'd done incorrectly, but thanks to
all the people who mailed me giving me advice (you know who
you all are!) I've sorted out my problem :

(i) I make absolutely POSITIVE I'm downloading in Binary,
(ii) I don't use AppleShare. Instead I download straight to the Mac.

Then it's just a simple case of using AppleExchange to transfer the
files onto PC disks which I can then read on my AtariST.

Thanks again to _E_v_e_r_y_o_n_e (<-Thats "Everyone" underlined)
who helped me!

This can easily be done with the MiNT-Utilities program xkey. You can find
mint-utils at atari.archive.umich.edu.

5401. Priam hard disk help needed

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-14 10:58:28 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <37lo8k$fih@lyra.csx.cam.ac.uk>
Source record: 29833
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I need some help with a Priam 330mb SCSI hard disk.
I have connected it up to my Falcon and it powers up OK.
However when it gets to SCSI 0 it says unit not responding still. (the drive does click a couple of times when it says this)

I think the problem is that it is set to the wrong SCSI id number, but I can't tell how to change it! There are no obvious switches on the drives except for a row of ten jumpers next to the SCSI connector.

I have looked through lots of adverts to find a company selling Priam drives, to see if they can help, but I can't find any...

The drive is formatted for a PC at the moment. This shouldn't matter should it? (as far as recognizing the drive, obviously I will have to reformat it to use it)

Thanks for any help,
Phil

From: slh100@tower.york.ac.uk (Shawn Hargreaves)

I am trying to write a function to fade the ST pallette (in 16 color
mode) to or from black, or even better between any two given pallettes,
ideally something like:
void fade_pallette (int p1[16], int p2[16], int speed)
I have tried just interpolating between the RGB values, but it is really
jerky. I have seen lots of games do this very smoothly, so what is the the
secret? Any suggestions would be very welcome.

I am trying to write a function to fade the ST pallette (in 16 color mode) to or from black, or even better between any two given pallettes, ideally something like:
void fade_pallette (int p1[16], int p2[16], int speed)
I have tried just interpolating between the RGB values, but it is really jerky. I have seen lots of games do this very smoothly, so what is the the secret? Any suggestions would be very welcome.

Someone else (Tom?) suggested this too. I agree that the name seems to suggest it, but that was the only desk*.prg file in the distribution, so what else was I supposed to try? The accompanying release notes refer to desktop.prg and mention some fixes made in 1.40a, with _no suggestion_ that this release was just for 020 machines (are there any? I wouln't have been surprised at 030, but 020??).
Actually my guess is that someone tampered with the original distribution from Wout Klaren (i.e. deleting stuff that wasn't useful to him/her) and then uploaded this faulty archive to a.a. Anybody got the right stuff?

Could you add WAV-playing to PLAYMPEG? I have some MPEG's with
accompanying WAV's. How would you synchronize audio and video?

Oh, and about registering; Could you email me a registered version if
I sent you a #5 cheque (I'm not in the UK) or am I being Dutch here ? :-)

Sounds like #5 extra for crossing the Canal is a bit unfair :-)

Sorry, I don't have the FPU manual at hand (it's at home 8km from here),
so I don't know about the 80bit format.
Converting integers goes like this, as far as I remember:

fmove.w shortinteger,fp0
fmove.l longinteger,fp0

Michael

Hi,

I'm somewhat confused here. Installing MultiTOS on my Falcon puts
a MINT.PRG in my AUTO. Apparently this MINT is really MultiTOS. But
what if I want to run MiNT the `old-fashined' way, i.e. a
single-tasking GEM with some TOSWINdows running multitasking shells?
I do it this way on my old ST and it works fine (i.e. faster than
MultiTOS on my Falcon) for me. So how do I disable MultiTOS but keep
MiNT? And what about the MiNT source version on a.a? If I compile
that one, will I then have MultiTOS? Guess not, as MultiTOS is
commercial.

Help me out, I'm baffled...

Thanks in advance,

Sander STоks

Well, what stops you from using a real free Unix, such as NetBSD or
FreeBSD? Bot *are* based on BSD4.4, which is even newer :-)

Both are more difficult to install than Linux on PCs, but once they
are installed they blow Linux away.

NetBSD has been successfully ported to several 68k-based architectures,
including the Amiga and the Mac. The Atari isn't among them. Why? Because
the Atari product line is deadder than dead, and noone does the port.

You just comment out the line "GEM=GEM.SYS" in your mint.cnf. MultiTos really is in the GEM.SYS-file with the ability to run GEM-programs concurrently. You can use the version available at a.a. I run MiNT 1.11h2 with and without MiNT and it works much better than earlier versions and is faster too. Some GEM programs that crashed when using earlier versions of MiNT now works like a charm...

Hi, I hope this is the right newsgroup for this sort of thing.
A friend of mine who produces music needs the following:

"A graphics emulator for a Gadjits Breakthru v2+ sequencer
to turn it into Apple Mac graphics & speed up screen
changes."

I guess this is some kind graphical front end for the sequencer ?

Anyhow, if anyone out there has one for sale or has any
questions or knowledge of this product please contact me by email,
as I don't have an ST myself, & don't often frequent this newsgroup.

Ta very much !

Richard.

Hi Peter,

Toad are at toad@genie.geis.com

Toad's phone number is : 410 544 6943

Fax Number (I called them from the UK to find this one out !) :
Fax: 410 544 1329

Address: Toad Computers
570 Governor Ritchie Highway
Severna Park
MD 21146 - 2925
U.S.A.

Incidentally, ICD are also on e-mail, they are icdinc@genie.geis.com
or icdinc@delphi.com

Hope this helps.
Cheers,
Kev.

5428. Falcon '030 Midi Sound Dr

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-14 18:28:00 UTC
From: eam..breen@f98.n250.z1.tor250.org

Source record: 29860

TYPE:LOST
AREA:COMP.SYS.ATARI.ST.TECH

From: eb4336@irix.bris.ac.uk (EAM. Breen)

Has anybody written a sound driver for the Atari Falcon '030 such that it could be linked to a sequencer or a program which could redirect MIDI output and input to it, so allowing it to act as a sampler?

I've found some Falcon-specific sound stuff gophering around Umich but they all seem to use either their own proprietary formats or amiga-tracker types. I'd like to see a program which used the resources of the Falcon to play sound, i.e. using the DSP and 680x0 (16/32MhZ '030 or 64MhZ '040 etc..) and the DMA stuff i.e. reading off/writing to the hard disc.

Considering that I heard talk of 32 channel sound trackers, the current limit of 6 channels (i.e. Mjuzakk, TrakCom) at 50KhZ/16-bit stereo seems a little meagre. Also I'd like to see a TRUE stereo system (as opposed to Mjuzakk) where the sound was delayed in the channel the voice was further away from, as well as altering the volume.

Combined with an audio/bass modification, this could blow Akai out of the water, at a price which would compare extremely favourably!

Perhaps I'm asking too much, but it seems like a worthwhile idea. If anybody has any extra info about DSPs/Falcon '030 sound I'd like to hear about it.

Thanks,

Ellis Breen

: available?

Screenblaster are supposed to be producing an Afterburner board which provides a 68040 processor, also apparently you can install more than 14Mb of RAM in the machine. (I assume that you are referring to the Falcon, as you mention the DSP in your subject heading).

Of course there are various types of floating point coprocessors available at different speeds and types and various other tweaks that can be applied, such as larger caches.

Happy tweaking

Ellis Breen.

Thanks for the feedback so far! One thing that may come into effect here
is that I'm using a Stacy with internal hard disk. Because of this I
can't use the ICD driver even though I'm using a Link2. I have to use
AHDI 3.01 in order to use the internal disk drive.

Uwe Seimet mentioned that an XHDI compatible drive would be helpful here.
I suspect that this version of AHDI is not XHDI compatible. True?
From what I understand I'm locked into using AHDI becuase of the Stacy's
peculiar internal SCSI adapter that connects to the 40Mb Conner drive.
If anyone knows different feel free to say so!

>above true? Are large file systems only a dream for me? Do I have choose
>between long filenames or big partitions? I certainly hope not. :-(

Well, I've certainly got a large MinixFS partition on my disk. I have
a Quantum ELS170S, ICD's The Link, ICD's driver software v6.1.4, a 4Mb
520STe with TOS 1.62, and MiNT 1.10h3 with MinixFS 0.6pl10 (I think).

My HD partitions are (approximately): 1x5Mb (TOS), 1x16Mb (TOS), and
1x150Mb (MinixFS). As far as I can remember, the filesystem installed
fairly easily... This should at least reassure you that it can be
done, even if I can't give more specific info! I seem to remember
repartitioning the disk several times before hitting on the correct
configuration!

Hope this helps...

I have no idea. Some high speed modems have had problems connecting with
lower speeds. If all you have is a 2400 baud modem, then I dont know.
I had a problem with one program when i used both the CTS/RTS and Xon/Xoff.

There is an archive named mintman*.zoo in a.a.u.e (if I recall right) which
contains manpager. This packet doesn't contain nroff and I haven't found
a decent nroffer for atari! The ones I have tried (maybe 3 or so) couldn't
manage to format nothing but dimple documents. I still haven't a formatted
version of my tcsh-shells manpages. So how do I read manpages? Well, I
don't. :-(
If anyone know good nroffer, please inform me!

Since i post the question, it is better let me to solve it.
Here is the matlab code to decode the 80-bit to a decimal number.

```
function x = ext2num(s)
%EXT2NUM MAC extended hexadecimal to double precision number conversion.
% EXT2NUM(S), where S is a 20 character string containing
% a hexadecimal number, returns the MAC EXTENED DATA TYPE
% floating point number it represents. Fewer than 20
% characters are padded on the right with zeros.
%
% For example, EXT2NUM('400cac44') returns 11025.
% EXT2NUM('bff') returns 0.
%
% NaNs, infinities and denorms are handled correctly.

if ~isstr(s)
error('Input to hex2num must be a string.')
end

% Convert characters to numeric digits.
% More than 20 characters are truncated.
d = zeros(1,20);
d(1:length(s)) = abs(lower(s)) - '0';
d = d + ('0'+10-'a').*(d>10);

neg = d(1) > 7;

if neg, d(1) = d(1)-8; end
if any(d > 15) | any(d < 0)
error('Input string to hex2num should have just 0-9, a-f, or A-F.')
end

% Floating point exponent.
e=0;
e = 16*(16*(16*(d(1)-4) + d(2)) + d(3)) + d(4) + 1;

% Floating point fraction.
f = 0;
for i = 20:-1:5, f = (f + 2*d(i))/16; end

% Scale the fraction by 2 to the exponent.
% Depends on your computer.
if e > 1023
if f == 0, x = inf; else, x = NaN; end
elseif e < -1022
```

```
x = pow2(f,-1022);
else
x = pow2(f, e);
end

if neg, x = -x; end
```

There is no XHDI compatible version of AHDI at all. Drivers supporting XHDI
are the German products HuSHI and HDDRIVER. Both are fully AHDI compatible,
BTW, and have a lot of very useful features AHDI hasn't.

>From what I understand I'm locked into using AHDI becuase of the Stacy's

>Ah. So this will come in handy when Linux68K is ready...

Yes and no :-). Linux is not the same as the TT SVR4, i. e. you can't use
the same boot mask for both Linux and the TT. There might be users with SVR4
and Linux on the same drive and so there must be different masks for both
systems. But this is no problem at all. Besides "TOS", "UNIX" and "None" you
simply need another option "Linux".

If it were that dead why are there a lot of people porting Linux? It simply seems that more users are interested in Linux than in NetBSD. This might be because in most magazines you read much more about Linux than about other free UNIX clones.

Hard & Soft from Germany offer a board that enables the user to choose bus
speed (16, 18 or 20 Mhz) and to double processor clock with a switch.
The modes available are therefore 16/16, 16/32, 18/18, 18/36, 20/20 and 20/40.

20 Mhz is about the most the blitter can stand. Any faster bus than that, and
the machine hangs. The board also includes a screen resolution enhancer, but
the software for it is not as flexible as that of BlowUp. I understand my
article on this is in the latest AEO.

This is from the german magazine ST computer:
LinuX
LinuX for Atari 030/040!
A complete Unix operating system on 20HD floppies. Includes complete operating system kernel, X-Windows, TeX, Tools u.v.m. [sorry, I don't understand that acronym] and a special (available only from us) instalation shell. In addition to that a LinuX handbook as ASCII text and a printed instalation manual.
Hardware requirements: a 68030 and approx 50MB HD space. Delivery in Oktober 94.
Price only 98 DEM.

I don't have any connection with theses people, I just read theri ad on page 97 of Oct, '94 ST computer.

5451. MPEG Player version 0.68

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-15 14:50:40 UTC
From: millert@grad.csee.usf.edu
Message-ID: <37oq80$1ld@mother.usf.edu>
Source record: 29884

This latest version of MPEG player can actually play most of my mpegs now.

But for about 50% of them, it puts my computer into some weird display mode that my multisync can't handle and all I see it a lot of flickering garbage.

I think the developer should check what kind of monitor is being used before he changes display modes.

And if it's a problem with 640x400 TC, then use a 256 color mode.

But aside from this problem, the program is coming along admirably.

> example of how to use it.

HighSpeed's normally excellent online help system comes up short on the Bios and XBios libraries, providing nothing more than a list of the functions, and their arguments. Not only are there no examples, and no descriptions or comments, if you do a Help lookup on an XBios or Bios identifier you don't even get taken to the proper place, you just get dumped at the front of one long window for the entire Bios/XBios library.

It's an annoying limitation, and one that I complained about 2 or 3 years ago to D-House and HiSoft, but nothing has ever been done about it (AFAIK).

As for the original question about making sounds, the DoSound routine takes a pointer to a byte vector, containing opcodes and data for loading the registers in the PSG directly. I'll try and dig up some details on that in the next few days.

George also indicated that he couldn't even make a beep. That part's easy: just do a Write (^G); assuming that the standard output hasn't been redirected away from its default, the console.

Off course someone will pipe up, here I am. :-)
But there might be a simple explanation why I have no problems with my
minix filesystems (the smallest is 256 KB). Could it be that the bug
only shows when the filesystem is on a partition of type BGM rather
than type RAW (or a special type like MIX or MNX)?

I am having some problems with pgpshell 0.9. After doing some testing, I found that it seems to be building the list of arguments for pgp.ttp correctly, but sometimes they are not making it to the program when it is executed. It consitantly does not work with some sets of options, and consistantly does work with others. This is similar to the phenomena of double-clicking some .ttp programs from the desktop, inputing some arguments, then clicking OK (and it doesn't work). Running the same command line from a CLI like Gulam works perfectly.

Can someone explain to me what is going on? It does the same thing from Neodesk, from a bare TOS 2.06, a bare TOS 1.2, etc. Basically, what are the "gotchas" for passing arguments to programs from GEM? I dimly remember something about everything being converted to upper case. Is this true? How does one properly pass a series of arguments when running an external program?

Thanks in advance for any assistance (I'll be relaying what I find to the author of pgpshell).

True.

> 2. It's faster to develop with someone else's library than to
> develop your library, then the program (or the lib functions
> as-you-need-them).

Also true, but are you more bothered about the effciency of program development or the efficiency of the finished product? There is a difference.

> 3. In a non-trivial program (ex, text editor), 60k is nothing. If
> you're worried about 60k, you're still running off floppies.

I have to disagree with this. For one thing, I am still running off floppies myself :-)

It is important to remember that although most programmer types do have loads of ram and hard drives, the majority of users (who never show up here because they don't have internet access) still only have 1 or even half a meg of ram and floppy disks.

60k is not nothing, it is a lot of space. Just a quick plug here: my own FED editor - which I have just released and which I am sure you are all checking out this very moment - manages to cram a decent load of features into about 40K for the entire program. And it was developed on a 1 meg ST with a floppy drive :-)

>only shows when the filesystem is on a partition of type BGM rather
>than type RAW (or a special type like MIX or MNX)?

I knew someone would! :)

The problem is in 'main.c' where memory is allocated for the bitmaps.
The calculation to work out the amount of memory required is done in
16 bits, but passed to kmalloc() as 32 bits & 0xffff. Now, as you can
guess, when the size of the bitmap exceeds the limits of 16bits...
(This would normally occur in the 200-256 Mb range, but is dependent
on the # of inodes specified by minit when the partition was created)

The end result is, the bitmaps are read into an area of kmalloc()'d
memory which is not big enough to contain them. I'll leave you to
figure out the consequences ;-)

This problem is not dependent on the type of partition (BGM, MIX or RAW)
but _may_ be dependent on what compiler you used to build minixfs.
I'm using Gcc2.5.8, but who knows, perhaps PureC, Sozobon etc, may
get things right by chance and hence you'd never see the problem.

Cheers, Steve

Adam,

Have you checked the extensions of the files that you're downloading to see if the files are compressed? If the extender is .LZH or .ARC or .ZIP then the files have been archived, and you will need to decompress them in order to use the files.

If the files are readable on the diskettes, that's most likely the problem. Look for a copy of ArcShell, ARC 6.02, and ST Zip 2.6 in order to extract the programs. Along with a copy of LZH.

regards,

Bob Brodie

Is there someone out there who can tell me about Fast Technology's T25 ST speeder-upper? I'll tell you what's happened.

I sent my Mega ST to Jim Allen of FT and he upgraded my T16 to a T25. He sent it back, but after hooking the system up, It seems to be running at 8mhz not 25mhz. I spoke to some guys from our user group, and they seem to think there should be some software to switch from 8 to 25 mhz and back. Jim didn't send anything with the machine, and he's quite hard to get ahold of... so I was wondering.

Can anyone tell me about my problem... maybe send me the software?

Thanks in advance for any help.

:>I think the developer should check what kind of monitor is being used
:>before he changes display modes.

The latest version of PLAYMPEG 0.68 switches to 480 pixels horizontal for
MPEGs of width greater than 320 pixels. This gives a horizontal scan-rate
of about 27.5khz, which some multiscan monitors will not handle.
Also v0.68 currently does not work on RGB, since I did not have access
to a TV/RGB Monitor to incorporate the new features - this will be fixed
in the next version though.

:>And if it's a problem with 640x400 TC, then use a 256 color mode.

256 colour mode is just not worth using, the conversion from 24bit to 8bplanes
would make the player very slow. Blame Atari for not including a chunky 8bit
mode.

:>But aside from this problem, the program is coming along admirably.

Cheers

>right?

Ive had problems skipping device IDs. With AHDI 6.04, it seems that if
I skip ANY, the search stops at the last found. For instance, if my
first external device is #0, and I hook, say a CD-ROM player at #6,
the machine doesnt search past #1

I dunno if this is normal

Only after I stired things up, I was also e-mailed that COMPO was not the agent
for the older Overscan products, and that was by COMPO, I was told to deal
with System Solution, I had aready tried that, but they were not intrested.!!..

PLEASE Ofir, how do I update my Tempus 2.07, Script and Signum II ,
No there is no English support for most German software...

I do state facts.....

AHDI stops at the first device "Not Responding"
Try SCSI tools instead (can configure what devices to check, and has
both ACSI, SCSI and IDE support in the same driver) and it's fast !!

Well the ICD Pro drivers have support for 21MB flopticals. This might work
with other types of removable SCSI drives.

> ST? Would be possible to run the Spectre emulator with it?

68010s are a non started on STs. They are not drop in replacement processors as most ST versions of TOS can't cope AFAIK (2.06 *might*).

Also the 68010 doesn't have an MMU unit, although unlike the 68000 it can work with one. The 68030 actually has one built in, which is why VM is available for 68030 machines.

The only way to get VM on a ST is to fit a PAK3 upgrade board. Its a *lot* more expensive than a 4MB RAM upgrade - but it accelerates the machine to faster than TT speed.

Just for the record - I was going to do this to my MSTE - but bought a TT instead. I now have 8MB of *real* memory and no need for VM.

:-)

Well this info doesn't endear me to Linux I must say. I can live with MiNT being only BSD in the losest sense. OTOH it runs my Atari software. If I dump MiNT in favour of Linux - it would be nice if it conformed to some standard generic UNIX. It seems that Linux might diverge quite badly from mainstream UNIX if people are not careful.

> MiNT? And what about the MiNT source version on a.a? If I compile
> that one, will I then have MultiTOS? Guess not, as MultiTOS is
> commercial.

The MINT.PRG is the MiNT kernel. The rest of MTOS is in the GEM.SYS file.

To run MiNT with out MTOS, edit the MINT.CNF file. In it is the line:

GEM=

or

INIT=

These define what the start process for MiNT will be. If you remove the
line - it should boot up ordinary GEM.

At least its *something* like that! ;-)

Didn't I mention it was Posix compliant? Oops, sorry. And Posix is
exactly `standard generic UNIX'.

MiNT I believe also aims to be Posix compliant (eventually).

5487. Atari Syquest -> PC or Mac

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-17 05:13:57 UTC
From: brad@halia.pbrc.hawaii.edu
Message-ID: <Cxsx7A.JB8@news.Hawaii.Edu>
Source record: 29768
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

We have data archived on Syquest cartridges that were formatted and written on an Atari. Alas, the Atari is no longer with us but we need to access the data on a PC or a Mac. We have no problem connecting our Syquest to either platform, what we need is software that will allow us to mount the Atari file system or somehow convert or copy the files. Is there such software anywhere? If not, would anyone with an Atari and a Syquest drive be willing to transfer some files to a DOS or Mac readable format?

Thanks for any help you can provide.

From: raei@ecid.cig.mot.com
Message-ID: <1994Oct17.085934@ecid.cig.mot.com>
Source record: 29771

hi,

My Falcon has NVDI and Screenblaster installed, running on a VGA screen.
My problem is that I cannot set screen resolutions properly, I am using the
Setscreen command (or the Lattice equivalent, may be Vsetscreen). Although my
program can change resolutions properly with these two not installed it fails completely
when they are...

Can anyone tell me how I should be doing this so Screenblaster (which I think
causes the problem) recognises the new res ?

Cheers

>>Does anyone else out there program on a Falcon in HiSoft Basic 2.10 ?
>

I used to - gave it up over the summer 'coz I was getting pea'd of with the lack of a decent development enviroment (no project manager, cann't even use MAKE 'coz no object files & linker), and when I mentioned this to HiSoft they said there was no way they would do anything to improve it....

Anyway, you might like to check out my DSP MODPLAY library for HB (based on BitMaster's DSP code). It can be found on ftp.uni-kl.de -the file is hbmodlib.zip or something like that....

Also, I'll be uploading an object oriented programming support library (OOPLIB) for HiSoft Basic in the next few days.

AHDI can be configured to check non consecutive device numbers. The AHDI 3.0
Release Notes describe how to do that. There's also software for configuring
AHDI, called AHDICONF.

Most hard disk drivers for the Atari, e. g. AHDI, HuSHI, HDDRIVER, recognize
DOS formatted partitions if these partitions are < 32 MByte. On the other
hand DOS drivers won't recognize Atari partitions. This means that you only
can exchange data between DOS and TOS if a partition is DOS formatted (or
has been partitioned with the appropriate option of the SCSITOOL software)
and if this partition is < 32 MByte.

Far be it from me to appear that I am standing in defence of Linux, but
you're way out of line here 8)

Linux has a rabid userbase. I mean _rabid_. One of the positive sode
of this is that _lots_ of stuff gets ported, even from the way-out
commercial unix platforms.

However, just like the *BSD unixes, it has a _very_ broad compatability
base, and porting most applications to any one of them is usually fairly
trivial.

Linux' real problems lie in its dubious networking code and its long-term
stability - there's nothing at all wrong with it as a small-scale
desktop Unix at all. I'm happy to see a unix of _any_ sort making it
to the atari platform. My preference would naturally have been for NetBSD,
but Linux is far better than a poke in the eye with a blunt stick.

Good question, I don't have a convincing answer. Is the observation
correct that mostly or even only Germans are porting Linux to the TT?
How far ahead is the Amiga port?

In terms of media coverage, even the Amiga is better supported, and
that company is bankrupt.

>It simply
>seems that more users are interested in Linux than in NetBSD. This might be
>because in most magazines you read much more about Linux than about other
>free UNIX clones.

True. At least in Germany, the lies and half-truths published by iX
and other magazines created a heavy pro-Linux bias. But I have heard
that Linux is supposed to be easier to install. How easy to install
is the Linux port to the TT going to be?

HiSoft Basic 2.10
=================

UPDATE version 2.0
==================

I've now tested all the RGB/TV resolutions. See the extra table.

FALCON SCREEN RESOLUTIONS
=========================

One major problem I had when making my programs was detecting which damn
screen resolution the user was loading my programs in. Could they be in
a weird True Colour resolution? If they have a VGA do they have the
Double Line On or Off ? All these questions and no obvious answer made
me fiddle around and here is what I found...

SYSTAB & GETREZ%
================

Both these calls are supposed to be used independantly, but with the
amount of resolutions on the Falcon it makes sense to combine their
results to find out the correct resolution and warn the user
accordingly.

```
r%=peekw(systab)
g%=getrez%
```

The above are the methods used from within HB. You will need to have
the Xbios library installed for the getrez command to work or else it
will return a value of 0 each time regardless.

RESULTS for a VGA
=================

```
Falcon Resolution SYSTAB GETREZ
-----------------------------------------------
```

```
4 colour, 40 column, DL Off 2 7
4 colour, 80 column, DL Off 2 2
4 colour, 40 column, DL On 2 0
4 colour, 80 column, DL On 2 1

16 colour, 40 column, DL Off 4 7
16 colour, 80 column, DL Off 4 2
16 colour, 40 column, DL On 4 0
16 colour, 80 column, DL On 4 1

256 colour, 40 column, DL Off 8 7
256 colour, 80 column, DL Off 8 2
256 colour, 40 column, DL On 8 0
256 colour, 80 column, DL On 8 1

True Colour, 40 column, DL Off 16 7
True Colour, 40 column, DL On 16 0

ST LOW 4 0
ST MED 2 1
ST HIGH 1 2

RESULTS for an RGB
==================

Falcon resolution SYSTAB GETREZ
-----------------------------------------------
2 Colour, 80 column, Int Off 1 1
2 Colour, 80 column, Int On 1 2

4 Colour, 40 column, Int Off 2 0
4 Colour, 40 column, Int On 2 7
4 Colour, 80 column, Int Off 2 1
4 Colour, 80 column, Int On 2 2

16 Colour, 40 column, Int Off 4 0
16 Colour, 40 column, Int On 4 7
16 Colour, 80 column, Int Off 4 1
16 Colour, 80 column, Int On 4 2

256 Colour, 40 column, Int Off 8 0
256 Colour, 40 column, Int On 8 7
256 Colour, 80 column, Int Off 8 1
256 Colour, 80 column, Int On 8 2

True Colour, 40 column, Int Off 16 0
True Colour, 40 column, Int On 16 7
True Colour, 80 column, Int Off 16 1
True Colour, 80 column, Int On 16 2

THAT'S IT!
==========
```

I am sure you can see from the above table that when you check the systab and getrez results if they equal 16 and 7 then the user is in the True Colour, 40 column, Double Line Off mode... and so on...

PROBLEM
=======

There is only one problem though. The ST LOW results (4/0) are the same as the 16 colour, 40 column, Double Line On (4,0). This is because essentially they are the same screen dimensions but you still might like to know which one of the two it is. Well I can't help you here I am afraid but if anyone out there can then PLEASE get in touch!

>>> Another problem is that there is no way to detect which type of monitor the user has. The RGB and VGA results are pretty much the same in most respecst, therefore you have problems, especially as although the systab and getrez results are the same, the display area available most certainly is not <<<

CONTACT
=======

Falcon owning, HiSoft Basic programming people please get in touch with me to swap ideas and routines.

Richard Davey, 10 Oak Drive, Portishead, Bristol, BS20 8QS, UK.
Phone: +44 (0) 275 843241
Email: requiem@armory.com

The email will become active again during October 1994. Please allow some time for a reply as all mail is forwarded to me when at University.

Anyone who wants details about the FALCON OWNERS GROUP just send me a single first class stamp and your address.

5501. Questions, Answers page ready.

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-17 14:49:33 UTC
From: msh@mserv1.dl.ac.uk
Message-ID: <37u2tt$b3t@mserv1.dl.ac.uk>
Source record: 29780

I have now included a questions and answers page in my Atari Web pages. If I get a decent response this should prove an invaluable service to those who use it. Please send any questions to me for inclusion and state if the question is for me personally or for the Q&A pages.

If you know the answers to any of the questions in this page then again mail them directly to me for inclusion. You will receive full credit for any answers you provide, and answers will appear in the Web page next to the question and will also be mailed directly to the person who posed the question for those who don't have Web access but want to use this service.

I rely on your support so please mail your questions and answers to me.

Thanks,

Mark msh@dl.ac.uk

Source record: 29781

Can anyone tell me how to get the MonType% command to work in HiSoft Basic 2.10 (in the Falcon library I believe).

I have a VGA monitor plugged in yet continuously get a response of 0 which assumes a ST HIGH monitor. Help?!!

Speaking of TeraDesk, I downloaded it from umich and was really
pleased with it. However, whenever I quit a program which I
had executed from TeraDesk, I catch a brief glimpse of bombs
and the system returns to the crappy GEM desktop. I assume
that this is not supposed to happen, but I have tried
everything and have not been able to avoid it. I have a
520STfm with 1 meg and a DSDD drive, no HD as of yet. It has
TOS 1.00 (yuk!). The only programs that are always in my auto
folder of my boot-floppy are Pinhead 2.1 (floppy accelerator)
and Flashdisk (reset-proof ramdisk). Anyone have any ideas?
Thanks in advance.

Out of curiosity what kind of performance does the Atari Transputer have?
Also is it simply a card that plug into the ST/TT or a complete machine
in its own right?

>correct that mostly or even only Germans are porting Linux to the TT?

There are Germans and Dutch working on it and they seem to be very
successful concerning the latest developments.

>How far ahead is the Amiga port?

As far as I know the Atari port has not reached the level of the Amiga port
yet but the differences are not that big. This is quite logical because both
ports are binary compatible.

>In terms of media coverage, even the Amiga is better supported, and
>that company is bankrupt.

Yes, that's strange but true, indeed.

>that Linux is supposed to be easier to install. How easy to install
>is the Linux port to the TT going to be?

Let's wait for the official release of Linux for the Atari next month.

5509. 2/6 ROM select ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-17 20:51:03 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10171994.205103@empyr.dircon.co.uk>
Source record: 29788

Hi, Sorry to all those who got this in atari.st My olr chops the end off the newsgroup name, and it wasn't until I uploaded the packet that I saw it was going to the wrong newsgroup. This is the correct one (I Hope)

Right, I have a friend who is sending me some TOS ROMS, I'm updating from 1.2 to 1.41. His ROMS are the 'six pack', I've looked in my ST and it has just two ROMS. There are a couple of soldered 'links' near the ROMS that look very much like selectors for 256k or 1M (6 or 2 ROMS), especially as ;

1) They have '256k' and '1M' written on the board and
2) They are near the ROMS !

:-)

Does anyone know which way to solder the links correctly to enable the 6 ROM configuration ?

(Any clever buggers who say 'The other way to what it is now', get a large custard pie on the head ! ;-) It is not too clear where the links should be, as there are a few possible places to connect.

Thanks in advance.

[short upgrade story: when I took the ST from 512k to 1 Meg, I had to remove the solder from all the holes in RAM bank 2 before I could solder in the new chips. Not having a desolder pump, I had a bright idea to use the hoover / vacuum cleaner nozzle on the underside of the board whilst melting the solder on the top. It was working great, solder disappearing out of sight, nice clean holes. Great....until I turned the board over and found the solder had spread all round the holes on the underside of the board, all over the tracks - everywhere ! Took ages to clean up whilst trying not to damage the tracks ! When it came to test the upgrade, I was too impatient to properly rebuild the ST first, so just balanced the floppy drive on the edge of the case and ran the test program. Upgrade was fine ! Then I knocked the floppy drive slightly and the bottom of it touched the shielding on the ST, which is earthed, and bzzzzzzt....one dead floppy drive. Moral: Get the right equipment, take it slowly and DONT BE IMPATIENT ! I know !! :-)]

ATARI Happening in Elmshorn/North Germany
-----------------------------------------

Announcement Update 10/11/1994
------------------------------

ECT Countdown (14 days !)
-------------------------

Computer Club Elmshorn e.V.
ATARI ST/TT/FALCON group
Postfach 261
D-25302 Elmshorn
Germany
Tel. 04121/83298
FAX 04121/92302

This is the eigth english announcement for the 5th Elmshorner
Computertage from the Computer Club Elmshorn e.V. On 29th and 30th
october is a big systemindependent computer exhibition in Elmshorn.
Elmshorn is a city 30 km north of Hamburg. The ECT has 10000 visitors
on average.

The exhibition are organized by the CCE e.V. and the city of Elmshorn.
The CCE e.V. is one of the biggest german systemindependent computer
clubs.

More than 70% of the exhibitors are ATARI dealers, ATARI clubs, ATARI
software producers and ATARI freaks. It's no PC show, it's an ATARI
happening. It's the biggest ATARI exhibition in North Germany since
the ATARI CeBIT exhibition 1992 in Hannover.

Venue is the KGSE Elmshorn (Kooperative Gesamtschule Elmshorn), the
street called 'Hainholzer Damm'. You can easy reach Elmshorn by train
or motorway.

Exhibition opening:
Saturday 29th october 2 - 6pm
Sunday 30th october 10am - 5pm
- no admission fee

- additional : - big cafeteria
- big tombola
- win an ATARI FALCON
- separate product presentations
```

I think you mentioned this - and I thought you would pick me up on it! ;-)

However I was sure that when I used to program under VAX/VMS, that VMS was supposed to be going Posix as well. Basically that Posix is not specifically Unix.

Oh - well I suppose it will have to do ;-)

:-)

The only figure I've heard was that a fully decked-out ATW would run at something like 1/5 the speed of a Cray X-MP (or was that Y-MP?).

And yes, it is a complete machine in its own right. In fact, you might say it's several machines, since it is actually a parallel computer.

I'm working on finding folks on GEnie who might know about it, but so far no luck. If I find out anything, I'll post results.

Currently only Germans (there were some Dutch earlier on, which AFAIK
have left the `scene').

> How far ahead is the Amiga port?

Not that far, Atarians are catching up quickly.

> True. At least in Germany, the lies and half-truths published by iX
> and other magazines created a heavy pro-Linux bias. But I have heard
> that Linux is supposed to be easier to install.

I get the impression that popular Linux distributions are more aimed towards
M$-DOS users that want to try something new/better without having any
previous knowledge about UNIX, while NetBSD better suits those who want to
bring the comfortable environment they're used to at the office to their PC
at home.

> How easy to install is the Linux port to the TT going to be?

Let's hope it will be as easy as installing 4.4BSD. ;-)

Waldi

5516. Questions regarding MegaSTe and Cartridges

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-18 03:23:14 UTC
From: higham@ist.flinders.edu.au
Message-ID: <1994Oct18.032314.38474@frodo.cc.flinders.edu.au>
Source record: 29695
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was wondering if anyone had experience with a Mega STe and cartridges,
namely Spectre GCR and Replay 16 or 8. I have seen a pic of a R.16 and
I think it would be a tight fit to get it to fit well on my Mega.

Hmmm, the main reason I bought it was for music, I hope a Replay 16 will
fit *8-/

Anyone got any of the above cartridges for sale, in Australia if possible?

Thanks,
Skip.

Ps: how about comp.sys.atari.>68000 for Falcons, TTs, Pak3s etc.
....well it seems appropriate. ;)

After diff-ing against the original sources I discovered I already changed
that part of the initialisation in minix_sanity(). No wonder I never
noticed any problems. :)

5518. TeraDesk 1.39 Problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-18 05:55:17 UTC
From: jws4p@Virginia.EDU
Message-ID: <Cxuts5.Cn5@Virginia.EDU>
Source record: 29698

I recently downloaded the desktop replacement TeraDesk 1.39
from atari.archive.umich.edu and was very pleased with its look
and features. However, when I exit any program run from
TeraDesk, I get a brief glimpse of bombs and then the system
returns to the crappy GEM desktop rather than the TeraDesk
desktop. I have a 1meg 520STfm with TOS 1.00 (yuk!) and no
HD. I am running TeraDesk from a reset-proof ramdisk
("Flashdisk"), as is suggested in the tera docs for those
without HD's. The only other auto-program in memory is PinHead
2.1, a floppy accelerator. I assume that when you quit a
program the system should return to TeraDesk (or else it isn't
very useful...), so I am wondering if the problem is with
running TeraDesk on TOS 1.00. Has anyone else had this problem
and solved it? Thanks in advance.
-John Stanmeyer jws4p@virginia.edu

DON'T send them your money!

Linux/68k is nowhere near ready for full release, the Atari version is still
rather unstable, swapping doesn't work properly and there are SCSI problems.
X is nowhere in sight for the Atari. You also need a 6888[1/2] for the
kernel to work.

This looks like a scam to get people to pay money for a non-existent product
then do a runner.

It may be a good idea to tell "ST Computer" about this advert too.

Not that I know of. It shouldn't be a big problem to convert the
Atari partition tables into a DOS-readable format, though. Since
most Atari hard disk drivers nowadays support the DOS partition
table format, you would then be able to read and write such
partitions both on the Atari and on DOS clones.

Volunteers?

> [...]
> The same goes for CPUs. Is there a safe check for a 68030 - or can I assume
> the CPU COOKIE will be set right?
>

You can try to enable the caches of this processor with the Cache-Control-Register (CACR) with the statement move.w Dx,CACR. You'll need a 68020/30 assembler to do this or you have to put this code into dc-statements in the text-segment.

You have to catch the illegal-instruction-exception. If you get this exception then it's a CPU < 68020. If not, try to enable the Data-Cache of an 68030 with setting bit 8 of CACR. If this works it's a MC68030 otherwise a MC 68020.

If you need a complete assembler routine for implementation send a pm.

Stefan

5532. 68030 in Adspeed STe board?

Newsgroup: comp.sys.atari.st.tech

Hi All!

I've just purchased an Adspeed STe board on the net, and can't wait until it comes! So here's the question: I've got a 68030 chip lying around, 16 mhz, and I was wondering if I could use it in the adspeed ste board instead of simply using the 68000 chip from my machine. Is this possible? Is it useful?

Thanks,
Steve

I have a Spectre GCR hooked to my MegaSTE, and it works just fine. I do
have to do a little "trick" to make the floppy work correctly each time
(access the floppy at least once while in ST mode before running Spectre),
but I think this is not just a MegaSTE thing.

You can't be serious. I have just written a survey of ST desktops and Tera
came last. It is nice, reliable, but it doesn't do much either. Take a
look at Gemini, Neo4 and Ease before you form such an opinion.

5540. SCSI-II device on MSTE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-18 17:36:59 UTC
From: der@discovery
Message-ID: <DER.94Oct18183659@discovery>
Source record: 29719

Hi netters, after 14 long months of absence from Internet I'm back.
For those wondering I've been down in Bosnia as a UN-soldier.

I'm having some serious problems connecting a second harddrive to
my MSTE. To start with, the SCSI-interface in my MSTE doesn't
recognize anything with an ID-no other than 0. Anything connected
to the bus with an ID other than 0 is just lost. :-(

However, by tweaking the 3 DIP-switches found on the SCSI interfaceboard
I can remap ID 0 to something else (f.e. ID 3). Unfortunately this
makes no difference when it comes to connecting more than one device
to the bus. The interface still keeps looking only for ID 0. ;-(

The big question is thus as follows: Is it at all possible to connect
more than one device to the MSTE using the original Atari SCSI-
interface?

BTW, I did remember to only terminate the last device!

To make it worse I'm also having problems connecting a newly bought
FastSCSI2 disc (Micropolis 1.04Gb) to the bus. I thought it was just
to replace the current 80Mb Seagate SCSI disc with the new one (I first
tried to connect both of them, but as I wrote above I had no luck doing
so). After some initial problems with jumpering out the parity-check I
managed to get the MSTE to recognize the disc. The problems began when
I tried to format/partition the disc. Atari's HDX gave up even before
starting, and a friends copy of ICD PRO didn't do much better. It did
at least start the formatting-process, but ended rather soon with a
"Sense #03"-error message.

Does anyone know if it's possible to connect FSII-devices to the MSTE
through the original Atari SCSI-interface?

In a week or two I'll have my newly ordered Falcon at home which hopefully
will solve my problems. However, it would be nice to know the answers to
the questions above just in case I sometime in the future would like to
upgrade my MSTE.

- Daniel Eriksson, der@astrakan.hgs.se

5541. Re: Using MinixFS with Mint on large partitions.

Thanks to all who offered advice! I've got my 224Mb partition up and
running now as a Minix file system. I did have to manually minit the
partition to get it sized correctly. The command I used was:

minit -V -n 2 -b 220944 -i 65535 -P I:

This got the size correct but for some reason was not able to 'lock' the
file system to prevent TOS access. Strange. I had tried the above command
without the -b and -i switches and values but it made me a 32Mb partition!
I had expected it would get the size correct, silly me! :-)

Thanks everyone!

5542. Gem WWW Programming Pages

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-18 18:02:11 UTC
From: d2cg@dtek.chalmers.se
Message-ID: <Cxvrv5.KMq@world.std.com>
Source record: 29721
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.announce

I have started a new Atari WWW page that is thought to fill out a bit of that huge gap that programmers feel once in a while. The pages will contain the information on system calls, hardware registers, Q & A, and everything a programmer might need to know.

There are a lot of hard work to go there, though, and I still need info on the new system calls of MiNT > 0.95, MultiTOS and TOS >= 4.0x.

Please take a look at the pages at http://www.dtek.chalmers.se/~d2cg/gem.html or http://www.mdstud.chalmers.se/~d2cg/gem.html and tell me what you think. I need suggestions on what the pages could contain!

> is: how do you access this global array with GNU C?

in the GNU C bindings you dont access the global array
directly. as per the atari developers docs, the user visible pieces of
info from the global binding array are declared in <aesbind.h> and are:

extern int gl_apid, gl_ap_version;

> Finally, is there any documentation for GNU C that talks about things like
> the global array? I have the documentation that explains compiler
> commands, but that seems to miss a few important parts of programming on
> the ST.

The (source) code is the documentation :-) We have taken some pains to
conform to the official developers docs. I dont have the Compendium,
so i dont know what that says.

>interface?

As far as I know this is impossible. You need an external host adapter.

>Does anyone know if it's possible to connect FSII-devices to the MSTE
>through the original Atari SCSI-interface?

Yes, this is possible. Most modern drives are SCSI II and normally they work on the ST. But there are some exceptions. Quantum Empire drives, e. g., require a driver supporting SCSI bus arbitration. Bus Arbitration is only possible with HuSHI and HDDRIVER for the SCSI bus of TT and Falcon, not for the ST. Because of this these drives probably wo't work with the ST dma bus.

>Okay - what is it based on? ;-)

Nothing. Linus invented it. Architecturally, it's pretty grotty inside.

>I was under the impression that some of the freeware BSD had made it into
>Linux (in fact a *lot* of it), and that this freeware BSD was something
>to do with the standard BSD 4.3.

The "standard" BSD is 4.4, which is what NetBSD 1.0 and FreeBSD 2.0 are
based on. There has been a little piracy of Net-2 code by the linux
people, but not a lot. It shows 8)

>Its not SYS V, or (hopefully not V7?) :-(

Linux has some SysV-isms, yes.

Well, not really. The supremely popular Slackware distribution is certainly
easy to install, but after that, it is real Unix, with all you need to do
very serious stuff. I took my config files straight home from work, then
my home machine was identical to here. It's actually BETTER than here now,
as the fvwm window manager is far superior to mwm.

Anyway, it's probably premature to be discussing Linux here.

5550. Re: What is Atari Transputer?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-19 01:58:43 UTC
From: higham@ist.flinders.edu.au
Message-ID: <1994Oct19.015843.52158@frodo.cc.flinders.edu.au>
Source record: 29730

The Atari Transputer Workstation is a parallel computer that is a completely separate machine from an ST. It used to retail for 1000's of pounds in England, and was NOT a home computer. I think it was used by companies for graphics work, I'm not sure, but obviously didn't make it as big as the corresponding machines made by SGI!!!

This is in contrast to the transputer device that was meant to be developed to plug into the ST in about 1990-91. I think it was meant to go in the ACSI port, but maybe in the parallel port. It would have interfaced with the ST in a parallel manner somehow (hence the name transputer), but I have not a clue how the 68000 fits into the deal. The speed boost for the ST was to boost it into the range of 15-20(?) mips and cost around 400 pounds. The colour pallete was also meant to be upped to ~16.7 million (24 bit) (again ?). Only problem it's more vaporous than the majority of Sam & Jacks wind-passing *8-), which is a shame because at the time, it sounded brilliant. I have some questions of my own though:

1. Are there any in existance?
2. What would have been the deal with existing software? (I have enough trouble with my Mega STe with its minor differences/improvements ;)
3. Would there have been, and is there any software in existance that takes advantage of it?
4. If 400 pounds was the RRP for it, why wasn't the Falcon, if comparably priced in regard to capabilities, priced at about 300 pounds :)

Hope this promotes some ramblings!
Skip

PS: anyone want to sell/give me Replay 16 or Spectre GCR....in Australia?

Oh, and I was just kidding about the Sam & Jack thing, I love them as much as everyone else.......take that however you want.

>Does anyone know which way to solder the links correctly to enable the 6
>ROM configuration ?

Do you have the Rom sockets fitted, if you have be carefull some sockets could be in the wrong way, all Roms are fitted the same way, pin 1 as the 2 chip sets are...

There should be 3 set of Pads, A16/17 and CE...

For 6 chip set roms the 256k pads are soldered over, (shorted) the 1 meg pad shold not be shorted, solder to be removed....

If you only have 2 rom sockets fitted, Please fit the missing rom sockets, use the double pin type, (has 2 contacts) like 'AMP' not the rubish Robinson Nugent ones..

Get your self a solder sucker, the USA brand SOLDAPULLT is very good, the Black ones are anti-static, or the Jap Goot ones is OK....

I have spoken to the guy who is working on the Falcon & TT version of Linux and he seems to think that it might be possible to hack out the FPU stuff to get a working linux without FPU.

When I asked if getting an FPU would allow me to run Linux he could give no solid guarantees. Its all still pretty much under development was the feeling I got.

What is the Hird...I have heard about it vaguely (no pun intended).

: Usenet but the mail always comes back to me. BTW I want to join the FOG and
: also I may be interested in doing some coding for the FOG update disk as I
: have Update 6 (I think) and I found it quite unreliable.....

I have been playing with the source code for ages and tinkering about, it seems to be a lot more sturdy now and reliable, all known bugs removed, text viewer is now the Revenge Doc Displayer which works a dream on the Falcon (i'd use MasterBrowse but it doesn't like command line data or Speedo GDOS 5.0). The shell is essentially the same though, just bug fixed and a new RGB version is out. Email should work to this address now, if it fails then contact me on requiem@armory.com

As for coding for the Update magazine - YES PLEASE!!! But it will depend on what you want to code of course. Some criteria for you:

It would have to be VGA, SVGA, Multisync and RGB compatible.
It would have to function within 4 meg of memory.
It should allow for plenty of article slots.
It should be able to execute external programs.
It should be able to DSP replay soundtracker music.
It should be able to display GIF files, at least at the quality of the current displayer I use.
It should work on all TOS versions from 4.01 to 4.04
It should offer a choice to disable the internal speaker :)
It should be able to run FLI animations.

I would also like an option to play WAV samples, but I can wait.

Please get in touch ASAP, thanks.

Would it be possible to fit 2 sets of TOS roms and a switch (to
choose which rom-set to use) in a 1040STE ?

I'm asking because I'd like to benfit from TOS 2.06 and still
have my old 1.06 or something for complete backward
compatibility(spelling?).

Is it possible?
Is worth the trouble?
Experience of upgrading from TOS 1.06 (or TOS 1.6) to TOS 2.06?
Which programs doesn't work and which does?
Any hints or ideas?

Can you recommend some good books to read then please. The manuals cover the basic functions quite well but don't do justise to the more interesting commands available from GDOS, GEM VDI, SPEEDO etc. I have found a real lack of example source code, both within the manual and out. I have the extra book with Falcon, DSP and Speedo commands in, but no source code means I might as well use it as a coffee mat. Even a little would have been good, I know it was a multi-format book (ie C and Assembler) so you couldn't direct source just to basic, but couldn't they publish a newsletter or something? I mean I paid a lot of money for the language and it's not that well supported, look at STOS - available for a few pounds and more user support than anything else I can think of.

It is a nice language, it is starting to do what I want it to do, but the learning process is a slow and frustrating one. I also have the Atari Compendium which does help in explaing some GEM functions further, but as I keep saying (sorry!) its source code I need... learn by example and all that.

|>
|>
|> Thanks in advance.
|>

If you have your TOS in 2 ROMs each ROM contains 1 MBit data (2*1MBit=256kByte,
the upper 64kByte are not used with TOS 1.XX).
If you switch over to 6 EPROMs, you replace the old 1 MBit ROMs with the smaller
256kBit ROMs (6 * 256KBit = 192 kByte).
So the names of the jumpers refer to the chip size, you use in your st. For 6 ROMs
you'll have to set all three jumpers to 256k, for 2 ROMs they have to be set
to 1M.
In the mega, atari 'forgot' the third jumper. In that case there is a little
patch at one small ttl chip to do, but i don't remember exactly, which it was,
but some years ago it was described in nearly every st computer magazine.

Hopy that helps,
Ciao,
Till

>If integrated with MultiTOS, this would be great.
>
>Karl Wilkinson.
>

If integrated with MultiTOS - this would suck major league. MultiTOS is far to slow and unwieldy in the first place, and an Xserver is a hefty chunk of code anyway - so to get any decent performance at all, you'll have to forget MultiTOS (a badly written heap if ever I saw one) and go for it as plain X.

On the X front, rumour out of germany say's that X for Atari Linux will be available before November ? I hope the performance is as good as X on Intel Linux, which is the dogs b*llocks, even on a 386. That would be a deciding factor in me buying a FPU (I hear you need one for Linux) and a new hard drive (X takes loads'a'space). Anyone know if OpenWindows is running on it yet ?

Perhaps the time is approaching for a Linux68K CDROM (as soon as the X stuff is out) ?

Craig.

|> in its own right?
|>
|> Rod
|>

I never saw a ATW, but i use some transputers with my st/sun and since the 'standard' transputers all have a similar speed, i might help you with my values. A T805-20 runs about 10-20MIPS. You will say, that this is not a very fast thing, but the more interesting fact with transputers is their capability of high speed communication: a transputer can use up to four serial 20 MBaud links without slowing the cpu down. These links, a boot rom and a little ammount of ram (~4kByte) is build into the transputer chip.

My transputers consist of the chip itself, 5 ttls for control purposes and 4 simms with 4MB ram each. Currently i use a three transputer system with three T805 with 16MB RAM each. This very powerful machine (i use it for image processing) fits into a little case with a size of ~10x20x30 cm^3.
The transputers are connected in a chain with my st. I use a (very simple) homemade link adaptor which fits on my cpu with two links and has a transfer rate of up to 500 kByte per second.

INMOS sells a compiler/linker/tools pack, that comes in a transputer version with a boot program for dos machines. It took me one week to translate this boot program for my st and to get it working with my st link hardware. This program automatically launches the required programs on the transputer, so there is no difference between programs running on the st or the transputer. The transputer programs are started from the st via double clicking them or using a cli. All in/output is done via the st. The transputer uses the keyboard, the (text) screen and the harddisk of the st without disturbing anything. I simply translated a pd raytracer to the transputer by pushing it thru the compiler and doing very few little patches, because one of the string functions was not implemented in inmos c.

Some day i wrote a graphic transputer server to let the transputer use my graphics card, now the transputer does a real parallel fractal calculation (funny thing, to see how three machines are drawing one picture) in a gem window at 256 colors without slowing down the st.

I know that the ATW had its own graphics controller, but it used the keyboard, harddisk and text screen of an st like my transputer does.

Ciao,
Till

Source record: 29738

Quick question for all you assembly language experts:
is it faster to access global variables or stack variables?
I am trying to optimise the inner loops of a graphics engine, so every cycle is crucial. Basically I have to decide whether to put data on the stack and access it with an address register + offset addressing mode, or declare it globally and then use the label to access it. I am no assembly language expert, so I would really appreciate it if someone could tell me which is faster.
Thanks,

Shawn Hargreaves "God is real, unless declared as integer."

: My problem is that I cannot set screen resolutions properly, I am using the
: Setscreen command (or the Lattice equivalent, may be Vsetscreen). Although my
: program can change resolutions properly with these two not installed it fails completely when they are...

I assume that you can change resolutions, but when you change back it freaks.
If that is the case. Setscreen is changing the resolution properly.
However, Screenblaster changes the VDI as well. SO even though your
screen might be 800x600, when you change back the VDI is set to 640x480.
I do not know the entry point to the VDI to reset the value.

I have been creating a new buffer, using VSETSCREEN to change the rez,
poking direct to hardware to change the screen location (hardware scroll
reg.) and not using VDI. Then to change back just reset VSETSCREEN
(xbios 88) and the screen should remain intact. The VDI was not changed.

Hope this helps.

slh100@tower.york.ac.uk (Shawn Hargreaves) writes:

>is it faster to access global variables or stack variables?

On the ST, address register + 16 bit offset will be faster, mostly
because it requires only one trip to memory to resolve the effective
address (ie. fetch the offset) compared to two trips for absolute.
(ie. 2 * 16 bit fetches). Such are the limitations of a 16 bit
data bus...

>I am trying to optimise the inner loops of a graphics engine, so every
>cycle is crucial. Basically I have to decide whether to put data on the
>stack and access it with an address register + offset addressing mode, or
>declare it globally and then use the label to access it. I am no assembly

You could set up an address register to point to the global data,
then use address reg. + offset to access it. This would save the
cycles required to push the data onto the stack, and there would
be no stack mess to clean up at the end.

If it's an inner loop, you may try to rearrange things so that
as much data as possible is jammed into the registers before
you start the loop/s. Use 'em all, that's what they're there for :)

Steve.

Hmmm, thinks of bugs:

Bugs found after two hours of Neodesk 4 useage.

Major incompatability with some programs in the AUTO folder, which ease runs along with, Kobold seems to be one of these on my system.

Problem with the icon editor whereby when exiting from it the right and bottom scroll bars lose their designated colours and settings (Neodesk settings, not using the CPX that is).

Exiting, or saving from the icon editor can sometimes result in 2-3 bombs.

Sometimes the gadjets button in the window settings menu entry sometimes fails to enter the gadjet dialog, occasionally saying that it is already active, when of course it is not.

The create group windows when searching for files corrupt, although they do straighten out once the search is completed.

Install applications, unless I've missed something you can only set two file extenders per program, which is next to useless.

Icon editor sometimes locks up when copying 200+ icons.

You can not install EDITRESS.ACC as the alternate file viewer without it getting totally confused, leaving the Edith function keys on the desktop.

Sometimes after closing a window near the top of the screen I get the top row of icons corrupted, or the top half moved 3-4 pixels to the right. This can be reset by reloading in the desktop picture.

The program does not seem to support the AV-portocol.

When saving files in Edith the tmp path vanishes on occasion, and the clipboards can get corrupted, with the system finally crashing out with three bombs and locking up solid. Any changes to the files are lost.

5585. PAK/3 + FastRam was: Virtual memory on Atari ST with MC68010

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-19 18:07:47 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <383n9j$bgs@ra.ibr.cs.tu-bs.de>

Roland Givan (rgivan@cix.compulink.co.uk) wrote:
: > I've read the 68010 is like a 68000 but it can support virtual memory.
: > Does anybody know how one can take the 68010 advantages on an atari
: > ST? Would be possible to run the Spectre emulator with it?

: 68010s are a non started on STs. They are not drop in replacement
: processors as most ST versions of TOS can't cope AFAIK (2.06 *might*).

: Also the 68010 doesn't have an MMU unit, although unlike the 68000 it can
: work with one. The 68030 actually has one built in, which is why VM is
: available for 68030 machines.

: The only way to get VM on a ST is to fit a PAK3 upgrade board. Its a *lot*
: more expensive than a 4MB RAM upgrade - but it accelerates the machine to
: faster than TT speed.

: Just for the record - I was going to do this to my MSTE - but bought a TT
: instead. I now have 8MB of *real* memory and no need for VM.

There will be a FastRam-Card for the PAK/3 soon (so I'm told).
64 MB with 32 bit bus and 40 Mhz sounds nice (and expensive).

I guess I will buy a PAK when this board is available
(but use 8 MB only)

5586. Re: XWindows for MiNT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-19 18:11:41 UTC
From: c0031098@ws.rz.tu-bs.de
Message-ID: <383ngt$bgs@ra.ibr.cs.tu-bs.de>
Source record: 29654

Karl S Wilkinson (wilknsnk@teaching.physics.ox.ac.uk) wrote:
: A few months ago someone posted saying they were porting X-Windows to MiNT.
: Has anyone heard anything since?
: If integrated with MultiTOS, this would be great.

: Karl Wilkinson.

I havn't heard of a port to MiNT, but a port to Linux68k is on the
way.

(Well, they are still arguing about ioctl and memory representation
of the screen loadable driver for different graphic boards...)

You can try my tutorial in ST Review. The HGT is also a good place to look
for examples. V2 of the HGT should be released soon.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)

i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

> so I don't know about the 80bit format.
> Converting integers goes like this, as far as I remember:
> fmove.w shortinteger,fp0
> fmove.l longinteger,fp0

My original request may have been slightly misleading. :)
I assum fmove is an operation executed on a 6888x FPU. I don't have an FPU,
but I need to be able to translate to and from the 80 bit float format.
I have scraped together something that seems to be able to recover the
integer part of the number, but something complete would be helpful.

SE>**

I have the same experience with connecting an Apple CD300-cdrom drive to
our removable Megafile 44 harddisk. Opening up the Megafile 44, we
found not only a Syquest555 removable harddiskdrive, but also two
SCSI-connectors. One of them is connected to the Syquest, the other is
empty. So we thought: let's connect the Apple cdrom to the second
SCSI-bus. Bad luck: the second SCSI-bus is apparently noy recognized by
the system (Atari 1040STF, plus Megafile44). Of course we tried all the
possible DIP-switch-numbers at the bottom of the Mega44-drive. None of
them works. Finally we pulled ou the internal Syquest555 from the first
SCSI-connector, and plugged it into the second connector. In the
SCSI-world, this wouldn't make any difference; all devices should be
recognized, whicever connector they are plugged in. In the Atari-world
this appears not to be true: our Syquestdrive is not recognized when
connected to the second SCSI-connector.
Our conclusion: the second SCSI-busconnector inside the Megafile44-drive
is not supported by Atari-hardware.
Our question: is this a valid conclusion? Any suggestions?

Marc

5593. piezo sounder for Atari STe

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-19 22:33:34 UTC
From: hallvart@ifi.uio.no
Message-ID: <3846ru$374@holmenkollen.ifi.uio.no>
Source record: 29671

I'm *still* looking for a suitable driver circuit for using a
pizeo ceramic element as a sound source for my STE.
Does anyone have such a circuit? And please, no more mails about
getting external speakers etc. I don't want that, I want my STe
to be as compact and with as little external wires as possible.

Thanks.

Hallvard, Oslo, Norway

> I've just purchased an Adspeed STe board on the net, and can't wait
> until it comes! So here's the question: I've got a 68030 chip lying
> around, 16 mhz, and I was wondering if I could use it in the adspeed
> ste board instead of simply using the 68000 chip from my machine.
> Is this possible? Is it useful?

No - it won't fit - and even if you built an adaptor board there are other problems.

Its not entirely impossible - but you will have hand built a large chunk of a 68030 accelerator board by the time you have finished.

:-(

Roland.

Note I (rgivan) didn't actually say this. This was written in response to something I wrote.

OTOH I will say that Linux is not stable in the long run because it it not really based on anything. If it was based on BSD Unix - then anything that happend to BSD would happen to Linux. As it is - its at the whim of the developers.

:-)

Roland.

> What is the Hird...I have heard about it vaguely (no pun intended).

Hird (Hurd?) is the Free Software Foundation's (of GNU fame) Unix *style*
kernel. It was to go with GCC, G++ and all the other Unix style stuff the
FSF did. Last I heard it had been shelved - what with advent of Linux and
Free BSD.

Roland.

Thanks - but I've decided against anything as flashy as this. What I'm planning to do is to use the COOKIEs as advisory. Ie if you try and run the wrong version of the program on the machine it will complain - but still give you thr option to run - just in case you really do have the right hardware - just not the COOKIEs installed.

:-)

Roland.

Also a link *is* an ICD card in a box (well more or less), and an ICD card does have software supplied (though not for as many different types of devices as the Link software).

:-)

Well, being a quite satisfied user of Lars-Erik 0sterud's Protect6, I'd say give that a try. It's a very inexpensive shareware program that runs from the AUTO folder and checks for boot sector and link viruses. It will wipe boot sectors if you want (and make them MS-DOS bootable) and give you a chance to reset you computer if one program starts to modify another.

There is also UVK6, which may be the best anti-virus program available (it's commercial), Sagrotan (very good shareware) which is in German, and finally an english shareware (released with only limited virus libraries, though) program that was a part of some disk magazine. It's available from umich, if nothing else. Hopefully someone here will remember the name.

Source record: 29667
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I got version 0.68 of MPEG play, and it works nicely, except for about half of my MPEGs. It throws the video hardware into some weird mode (probably NTSC or PAL) that my multisync monitor can't handle. It would be nice if it didn't do that.

I have this really old MPEG player that does 1fps. That program doesn't screw with the display modes, it's in color, and it works with ALL of my MPEG's.

And swapping does work properly.

Floppy and CD-ROM drivers still need a bit of improvement, and it would be
nice if an SCC driver were available.

To avoid confusion: there is not _one_ guy working on Linux for Atari computers, there are several. Also, there is one m68k sourcetree for Amiga and Atari (the difference between the platforms is mainly in the hardware specific drivers).

> What is the Hird...I have heard about it vaguely (no pun intended).

The name is the Hurd, I've appended part of the FAQ (point 2 is outdated, the Hurd has currently reached the point where it can bootstrap itself).

Regards,
Waldi

>--<
The GNU Hurd FAQ
================

1. What is the Hurd?

The Hurd is the high-level operating system for GNU, currently under development. The whole point of GNU is to provide a replacement for Unix, so the Hurd is multi-tasking and multi-user, and will have networking and X-windows and all the Unix usuals.

2. Where can I get a copy?

To put it simply, you can't. It is still under development (by Michael Bushnell, Roland McGrath and Jan Brittenson). In fact, the Hurd has not even reached the point where it can bootstrap itself; even if you had a copy of the Hurd, you would still need some other proprietary operating system running Mach 3.0 to get it running.

3. Why bother writing an new OS when we have Linux and 386/BSD?

For one thing, Linux and BSD don't scale well. Hardware designers are shifting more and more toward multiprocessor machines for performance, and standard Unix kernels do not provide much multiprocessor support. The Hurd, on the other hand, runs on top of the Mach 3.0 micro-kernel [[1]] from CMU. Mach was designed precisely for multiprocessing machines, so its portability should carry over nicely to the Hurd. It's a design with the future in mind.

In addition, the Hurd looks like it will be considerably more flexible and robust than standard Unix. All possible features have been moved into unprivileged space, where they can be replaced as needed. Users will be able to write their own file systems, their own process servers, or their own network protocols if they like.

It is instructional to compare this flexiblity with how Linux handles similar facilities. Under Linux, anyone can write their own file system, but to do so they must reprogram the kernel. This is at best inconvenient; every edit-compile- debug sequence requires a reboot, and debugging tools are typically unavailable. Bad programming, meanwhile, runs the risk of locking or corrupting pieces of the system. The Hurd will allow a user to develop a file system just as he or she would develop any other program, with all the protections against errors you would expect.

4. So will I have to learn Hurd programming to run the system?

Not at all. The Hurd design has all of its special features hidden by the GNU C library and by various Hurd servers. As far as any Unix program is concerned, a Hurd machine is just a simple POSIX-compliant box. For practical purposes, anything that you can port to Linux will also port to the Hurd.

5. Where I can I find more information?

There is a snapshot of the development tree on "alpha.gnu.ai.mit.edu" in the "/gnu" directory. It is updated irregularly, and guaranteed not to run (see question #2).

You can subscribe to the Hurd announcement list by sending a request to "hurd-ann-request@gnu.ai.mit.edu". This is a moderated list that allows developers to coordinate their efforts, so it's probably not worth the bother to subscribe unless you (a) have a proper machine (as described in question #2), (b) know Unix internals and Mach very well, and (c) have a lot of free time on your hands.

Two informative texts have been placed on the end of this message.

Footnotes:

[[1]] Yes, I know that ``micro-kernel'' is about as apt a description as ``Reduced Instruction Set Chip, but we're stuck with it.

5608. finger

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-20 03:38:09 UTC
From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <EidSMVC00WB74fJ0pi@andrew.cmu.edu>
Source record: 29673

I'm having a couple of problems with finger (running Mint and a slip connection to the net) that might possibly be related.
If I try to finger outside of my computer, the finger program doesn't recognize the @ symbol. For example, if I finger dw4g@andrew.cmu.edu it tries to find dw4g@... locally. I looked at the finger code (which came with mintos) and it doesn't seem to do any checking for the @ symbol. If this is indeed the case, has anybody ported a better version of finger to Mint? If not, what do I need to do to fix my setup?
Also, when I try to finger my machine from outside, I don't get any output. The fingerd seems to run, and my HD is accessed, but no user information is displayed on the remote machine.

Thanks,
David

After Hermes dumped over 3500 files into one directory yesterday, I'd be
very temped to call GEMDOS something worse than a poke in the eye with a
blunt stick.

The poke doesn't take 16 hours to finish. Now _that's_ painful,
especially on a single-tasking machine.

> (1000 cheers for MiNT for giving us new eyes and Linux 68K for giving

It's a pity Atari hardware faster than my ST is priced out of reality.

Try compiling the UW server code.

About the only networking services needed by the UW server are the
unimplemented ones in Linux (as of 1.0.2 kernel, or whatever was in
Slackware 1.2).

Why do I have to read all this crap about a upsurge in Atari support
in ST-Review and ST-Format..

Like the Germans are droping there PC clones for Ataries..

Silica Shop in the UK opening up a group of Atari shops..

This to me can't be true at all..

A lot of German software houses have droped Atari, or have droped
English support...

German magazines reduced to one...!!

UK magazine closes...ST-User...

UK computer show was a flop for Atari people...

Codehead drops Atari...

Calligrapher support droped.

Falcons being dumped..

Paragon Computers in OZZ have closed, they were Big...

Still can't get PAL Jags here...

Unable to get spare part for STE computers, (UK), this chap tried many UK
firms, some said yes but did not deliver, he ended up getting
it from the service agent in OZZ......

So come on you Magazine Editors how about telling the truth for once...

5614. Amiga/Mac/PC --to---> Atari HELP Please

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-20 07:06:22 UTC
From: dhazelwo@lawson.its.utas.edu.au
Message-ID: <1994Oct20.070622.20278@cam.compserv.utas.edu.au>
Source record: 29690

Hi,

In an attempt not to make the usual foolish post where people uninformed cry and beg and plead for help, could I ask if anyone would be able to help me with file conversion between an Amiga, Mac or PC to an Atari...

A friend of mine (whom obviously I'd like to help out) would like some of the files stored on Atari ftp sites, but has no direct net access, and therefore would need to transfer the files through me (I have access to Mac/Amiga/PC/Unix platforms and conversion tools between each) and I have nothing to run on the Atari that will allow it to read files from Amiga/Mac/PC disks.. I know conversion programs are out there on the net, and I was wondering if anyone would be able to put any available conversion programs onto an Atari disk and mail it to me, here in Tasmania. I'd offer $5 Australian to someone who would do it for me as this is quite important to my friend (considering the wealth of Atari files out there on the net) to pay for postage (and with a computer disk it would be quite minimal. I'd preferrably like someone within Australia to do this, as the $5 wouldn't be worth their while doing it... but if it's from outside Australia, I'm sure we can come to an agreement :)

Thank you greatly to anyone who can help, and here's the email address you can contact me at :

dhazelwo@lawson.its.utas.edu.au

cheers,
Dylan.

>but Linux is far better than a poke in the eye with a blunt stick.

I think you'll find that the NET3 networking code is pretty good, far better
than the NET2 code. A friend of mine has his old Sun 3/80 booting over the
network from his Dell 486dx2-66 EISA system and using the Dell as an NFS
server.

As for long term stability, the machine sugalaxy.swan.ac.uk has been know to
run continuously for well over 6 months with heavy load (both CPU and
network) only being taken down to upgrade the kernel.

I'm a BSD-phile.. I don't mind Linux, though it does have some annoying
SYSVr4-isms. You can't have everything.

In the future I am considering installing a 32MHZ (the 60 ukp version)
clock doubler in my F030. I therefore have a few questions.

Does most of the software still run?
Can I switch to 16mhz if I need to?
Is the performance improved by the enhancement?

I haven't heard of "Kobold", but if you can point us (or send us) a copy
we will definitely look into it. What are these other AUTO folder programs
that you are having trouble with? Our AUTO folder code is pretty clean, so
it has been known to work with just about everything (trust me, we've
tested and evolved it quite a bit over the last 6 years).

> Problem with the icon editor whereby when exiting from it the right and
> bottom scroll bars lose their designated colours and settings (Neodesk
> settings, not using the CPX that is).

I haven't heard of this before (nor been able to reproduce it). Is this
while running Geneva? While running release 002 (current release)? I'll
try playing with it and see if I can reproduce it.

> Exiting, or saving from the icon editor can sometimes result in 2-3
> bombs.

I can think of one potential area for trouble here (though rare) which was
fixed in release 002. If this is still happening to you in release 002,
I'd have to investigate further and see if I can duplicate it.

> Sometimes the gadjets button in the window settings menu entry
> sometimes fails to enter the gadjet dialog, occasionally saying that it
> is already active, when of course it is not.

Haven't heard of this. Does this happen after you've entered the window or
dialog settings dialog once or the first time you've entered it?

> The create group windows when searching for files corrupt, although
> they do straighten out once the search is completed.

Not sure what you mean by this.

> Install applications, unless I've missed something you can only set
> two file extenders per program, which is next to useless.

You can easily add more extenders to one program by editing the NEODESKx.INF file and having multiple entries for the same program. You can also do this inside of NeoDesk by creating multiple NPI files. In addition, you can use wildcards (".T*", ".TX?", etc.)

> Icon editor sometimes locks up when copying 200+ icons.

We've tested this to over 1,000 icons per NIC file. Hmmm. Maybe there's something else going on, like your system is running out of memory and then who knows what freaks out. I'll take a deeper look into this and see if I can come up with some way to duplicate it.

> You can not install EDITRESS.ACC as the alternate file viewer without
> it getting totally confused, leaving the Edith function keys on the
> desktop.

Haven't heard of this utility. But if the desktop isn't getting redrawn it sounds like the viewer is not handling screen redraws correctly. If you are using Geneva, you can set some flags to help with this. Other than that, I can't really think of another solution (there's no way for NeoDesk to know that some program didn't redraw the screen correctly).

> Sometimes after closing a window near the top of the screen I get the
> top row of icons corrupted, or the top half moved 3-4 pixels to the
> right. This can be reset by reloading in the desktop picture.

Haven't seen this before.

> The program does not seem to support the AV-portocol.

It currently doesn't have a need to.

> When saving files in Edith the tmp path vanishes on occasion, and the
> clipboards can get corrupted, with the system finally crashing out with
> three bombs and locking up solid. Any changes to the files are lost.

NeoDesk doesn't manage paths, it simply lets you set them (in case you hadn't set them already). The only thing I can think of, is that NeoDesk has the ability to override system variables. If you set an environmental variable in NeoDesk, and then have NeoDesk "replace" the system environmental variable while running that one program (with an NPI file) then you might see a variable come and go (an effect of the variables being replaced whenever you run a program).

--- Conclusion ---

I think I need to clarify a couple of things:

First, not all programs are perfect. If "x" program for some reason acts up when it runs with our desktop, it doesn't automatically mean that there's some big nasty bug that we decided to leave in the code. We look at such programs, and see if there is a way we can work around whatever problem it has (trust me, there's a substancial part of the NeoDesk code

just dedicated to making things work with buggy programs..everything from Animator ST to ZoomRacks, things that don't work in ANY other desktop--be nice if reviewers noticed that).

Second, we can't help you if we don't hear from you. This is the first time I've heard of your problems (which I stumbled into by accident, our news server doesn't catch all atari newsgroup messages). Many "problems" can be addressed with a simple e-mail or telephone call.

Third, to be able to fix a problem, we need to duplicate it. This is much harder than people think. We spend 75% of our bug-fixing-time just trying to duplicate a problem. Once we duplicate it, it only takes seconds/minutes to figure out what is wrong and formulate a strategy for a fix or work-around.

Finally, we really DO listen! It is due to communication with our customers that we released the patch for release 002. It fixes things people found and adds several features that were wanted. This is something that we've always done. Next we will release a Geneva patch (that will hopefully answer all those Mint user requests...yay) and down the road you are very likely to see future NeoDesk and Geneva patches.

Anyways, I hope I made sense in this long letter. ;-)

5625. SCSI drive not being recognized

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-20 16:45:05 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <3866qh$j80@lyra.csx.cam.ac.uk>
Source record: 29558
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Eventually, I have got my Priam 330mb hard disk to work....

But the problem is that it is not being recognized on boot-up.
(on a Falcon, Tos 4.04, only SCSI device)

In fact, the only way to get the Falcon to see the drive is to manually
load ahdi.prg (version 6.06) four times while in a VGA mode. It always
works on the fourth attempt.
It will *not* work at all on boot-up, or in a RGB resolution, whatever I do.
I have run hinstall on the first partition of the drive but that makes no
difference.

Once it has been seen, it works OK.

Any help is much appreciated!
Phil

: bootup resolution, I found a `preference' switch: `Keine' (none), `TOS'
: or `UNIX'. I selected UNIX, but my Falcon wouldn't boot from HD
: anymore. What is this switch for, anyway?

: Thanks for any replies,

Oh dear you have found the one VERY fatal error in the NVRAM on the Falcon.
BootConf will make your Falcon not only ignore the HD but it can also
ignore the fact you want to boot to GEM. There is a program called
FALCFREE.PRG, all it does is place a special boot sector on a disk. This
disk should then be clearly labelled and filed away with the rest of your
household treasures, because if your Falcon ever hits an NVRAM unfriendly
program and you find it locked up - this single disk will cure your
problem, just throw it in the drive and all will be reset to the original
UK settings.

Richard Davey
Falcon Owners Group (UK)

PS If anyone hasn't got this program I will Uuencode it and upload it
here, it is a rather essential program!

5630. Do not join the Falcon Owners Group UK

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-20 18:22:40 UTC
From: S925377@mailserv.cuhk.hk
Message-ID: <S925377.6.0048C503@mailserv.cuhk.hk>
Source record: 29611

Hello everyone, including Richard Davey of Falcon Owners Group in UK,

I am warning everyone in the atari falcon world not to join the FOG UK.
This is because Mr Richard Davey is not a reponsible person.

I wrote a letter and paid by bank draft to FOG UK to Richard Davey , who is the chairman of FOG, subscribing to falcon update, which at that time, only issue one was out. After a longtime, I still haven't received any magazine and I wrote to FOG UK again, I think this was in late 1993, and then FOG sent me issue 1 and 2 together, without any explaination for the delay. Well at first, I guess may be FOG has not been successfully establised because sale of Falcon was not good in UK. And I waited for months. Then I wrote to Mr Richard Davey, since I read from internet that FOG UK was still here, complaining the delay, asking for reasons, and asking for refund if he can't maintain FOG or if he can't send me magazine. FOG then sent me issue 4, again without explanation for the delay and without issue 3. I read the disk magazine issue4 and I discovered Richard Davey's email address. I sent a email to him, around mid94, mentioning about the above situation, and asking for issue 5 to be sent on time, as Richard Davey stated in issue4 that issue 5 will be out soon. He did reply to me at that time by email, saying that issue 5 will be sent to me soon and he has a problem when sending issue3 with the mailing company and he will explain the situation later. However that is all! No more reply or message or magazine from FOG UK.

I still haven't received any further Falcon update magazine since that time. And about a month ago, I wrote a email to Richard Davey again saying that I still havn't got issue5. And of course, no reply.

I do not always read usenet. But as I am now reading, I see that Mr Richard Davey is still alive, FOG UK is still here, and FOG UK is still recruiting members around the world through internet.

And that falcon update issue7 is going to be out soon.

TO Mr Richard Davey,
I had ordered Falcon update issue 1-6, including the disk softwares, in august 1993. But you have not sent what I have ordered, and what your company, FOG UK promised to send me, which means you have void the contract between your company and me. I did not order overdue magazines, which means all the magazines(issue 1,2,4) you sent to me is not the magazines I have ordered. And I am not supposed to write to you every several months asking for an overdue magazine. FOG UK should have sent me my copy when it was out as I had paid for it. But FOG UK did not do that. And therefore I am now asking for a total refund. You do not have to send me anymore overdue magazines. You have sent me nothing that I have ordered. You have broken our contract and I am entitled to the total refund.

To everyone,
Well, I don't think I am going to sue FOG UK even if they don't give my money back. After all, I don't care too much about that little amount of money. But I reserved my right to do so.

Therefore I would like to warn everyone in the world not to join FOG UK, a group or company that will take your money but will not fulfill their promise, which I consider as irresponsible. It is a shame, not only in the atari world but to the whole mail business in the world ,to have such a "cheat money" group.

If anyone, including Mr Richard Davey of FOG UK, has any response to this letter/mail, please mail to me directly as I don't read usenet often and please send your reply to usenet also to let everyone to know about this, particularly reply from Mr Richard Davey FOG UK.

Yours,
Malcolm Fung,
s925377@mailserv.cuhk.hk

Hello People.
In noticing that LINUX is on the way, and that I wanna be running X11R6 ASAP
I have come up with the following quiestion.

Does anybody know of a dirt cheap 8MHz or similar 68030 upgrade for a
bog standard ST that is so cheap that a student can afford it????? If
not, why don't we design one?? It would offer speed increase, if only
on the higher efficiency.

I eagerly await responses from other clever boffs everywhere :-)

[...]

>My original request may have been slightly misleading. :)
>I assum fmove is an operation executed on a 6888x FPU. I don't have an FPU,
>but I need to be able to translate to and from the 80 bit float format.
>I have scraped together something that seems to be able to recover the
>integer part of the number, but something complete would be helpful.

Here is the description of the extended precision binary real format used
by Motorola in their 68881/2 FPUs (from their User's Manual) :

bit 0 .. 62 fraction (f)
bit 63 integer part (i)
bit 64 .. 79 all zero
bit 80 .. 94 biased exponent (e)
bit 95 sign (s)

interpretation of sign:
0 positive mantissa
1 negative mantissa

bias of exponent: 3FFF

representation of real numbers:

(-1) ^ s * 2 ^ (e - 3FFF) * (i.f)

normalized numbers:
e : 0 <= e < 7FFF
i : 1
f : zero or non-zero

denormalized numbers:
e : 0
i : 0
f : non-zero

signed zeros:
e : 0
i : 0
f : 0

signed infinities:
e : 7FFF

i : don't care
f : 0

NANs (Not A Number):
s, i : don't care
e : 7FFF
f : non-zero
bit 62 = 1: non-signaling NAN
bit 62 = 0: signaling NAN

Note that the explicite integer bit does NOT exist in single or double precision format. There the integer part is always assumed to be 1. If you need these formats, I can provide them as well.

I hope that helps.

[...]

Theres never a 'need' to support any protocol, however, the fact that Ease
and Gemini support this protocol gives them additional and very useful
features. Supporting the AV protocol is a fairly trivial programming task.
Something that Dan Wilga can solve in a few minutes.

Well, I could adopt your approach and say "Fix the fucking thing
yourself". But that would imply that I agree with your assessment of
the problem so instead, I'll suggest you run it as a PRG rather than as
an ACC and get a screen accelerator. You should then get excellent
performance.

Hello out there!

Has anyone of you tried to connect an Atari ST (I own a MegaST 1)
to the new Sony multiscan monitor 15sf (15"). Does it work, and if
it does, what must be done (adapters,...)?

Grateful for all hints

Ralf

It _is_ possible that it is Neodesk that is not drawing properly; I have certainly seen redraw problems regularly with NeoDesk 3.03, and saw them again when playing with the ND4 demo.

>Second, we can't help you if we don't hear from you. This is the first

I suggest you speak to your UK distributors (compo uk), Rick, as this list of problems was posted on CIX, and Compo claimed that they were forwarding all such comments to you.

I'm following this closely as I am still undecided whether to upgrade to v4 or to switch to Ease.

Well everyone makes mistakes.

The point about TeraDesk is the old Atari catchphrase 'Power Without the Price'. It does just enough for many without a lot of expensive unnecessary baggage.

Presumably you rate the Medusa higher than an ST but for many the latter is more than adequate and for some incomes and/or favourite games/programs the only choice.

There is rarely a single correct choice.

: mode.

Ok. Here's a deal: I'll help you write code to efficiently do 256 color
modes (which I have), and you make me a registered user.

It takes blocks of pixels and converts them all at once to display on the
screen. I'm sure it could be improved, but it's on the order of 4 times
faster to plot 16 at once than to plot 16 one-at-a-time. While my
routine to draw 1 at a time (which I got from DMJ so I won't give THAT
out) is able to draw one pixel at a time MUCH faster than any thing else
I've encountered. It was at least twice as fast at my fastest routine
and an order of magnitude faster than the OS's code.

Sure, it's slower than using TC modes, but it's still pretty good.

How's that?

5648. Questions, Answers page ready?

Yes, you need a board such as the Mighty Sonic - a 32Mhz accelerator that also
allows you to fit a ridiculously huge amount of fast ram, 256Mb I think.

From: gaghon@nevada.edu
Message-ID: <38903b$ev5@news.nevada.edu>
Source record: 29582

There is one thing to remember about MultiTos and Xwindows. It is not the 'Mint' part that is slow, its the 'AES' part of MultiTos that is slow.

I would assume that Xwindows handles window operation and such. If that is true, you would not need 'AES'. It would be more like Mint and Xwindows. Since the 'AES' part of MultiTos would be eliminated.

Vince

AFAICR the 'cheap' transputer addon just used the atari as a front end.
It didn't actaully run Atari software any faster - but was more designed
as an educational tool for transaputers.

They were advertised for some time and I'm sure I saw a review. Never met
anybody with one though.

Roland.

EAM. Breen (eb4336@irix.bris.ac.uk) wrote:

: Has anybody written a sound driver for the Atari Falcon '030 such that it
: could be linked to a sequencer or a program which could redirect MIDI
: output and input to it, so allowing it to act as a sampler?

: I've found some Falcon-specific sound stuff gophering around Umich but
: they all seem to use either their own proprietary formats or amiga-tracker
: types. I'd like to see a program which used the resources of the Falcon to
: play sound, i.e. using the DSP and 680x0 (16/32MhZ '030 or 64MhZ '040
: etc..) and the DMA stuff i.e. reading off/writing to the hard disc.

: Considering that I heard talk of 32 channel sound trackers, the current limit
: of 6 channels (i.e. Mjuzakk, TrakCom) at 50KhZ/16-bit stereo seems a little
: meagre. Also I'd like to see a TRUE stereo system (as opposed to Mjuzakk)
: where the sound was delayed in the channel the voice was further away
: from, as well as altering the volume.

: Combined with an audio/bass modification, this could blow Akai out of the
: water, at a price which would compare extremely favourably!

: Perhaps I'm asking too much, but it seems like a worthwhile idea. If
: anybody has any extra info about DSPs/Falcon '030 sound I'd like to hear
: about it.

: Thanks,

: Ellis Breen

--
The only thing I know of so far is included with Clarity Replay. It
doesn't use stereo samples but you can pan them. It lets you assign a
different sample to any note and trigger it thru MIDI. Very basic but
somewhat usable. I've heard of other things rumoured to be on the way but
I have no real info on them.

5659. Serial Port Fix ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-23 13:07:40 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <10231994.130740@empyr.dircon.co.uk>
Source record: 29591

Hi,

I've got a 520STFM (1Mb RAM), TOS 1.2 (1.02). Serial Port works great at 19,200 for downloads, no faster than 9600 for uploads (no patches running).

I have a few serial port fixes, including HSMODA04, and whilst they seem to let me run the port at 19,200 for uploads, they slow they whole thing down. e.g. If I run HSMODA04, (and that seems to be the only one that actually *works*), I get d'loads of 970-ish cps on a 9600 modem, with zipped files. If I take the patch out, I can get 1040 cps +, but then I can't run the port at 19,200 for uploading. If I run the port at 9600, I get around 925 cps (no patches).

I know you can configure HSMODA04 to your own specs, but I can't because the config program & docs are all in German, and I can't understand it !

Anyone know of a good RTS/CTS patch that *works* and won't slow the port down ?

Cheers.

Kev.

Source record: 29596

> There will be a FastRam-Card for the PAK/3 soon (so I'm told). 64 MB
> with 32 bit bus and 40 Mhz sounds nice (and expensive).

Yup - I heard about this too (and a graphics board). The problem was that neither product was actually shipping. A PAK3 was going to cost me around 600ukp one way or another. Even then I'd still be waiting on the memory board as inquirys led me to believe that running GCC in 4MB and VM was not going to work.

I still think the PAK3 is an excelent product. For owners of MSTs (who can get it in the case (apparently)) its actually a very cost effective upgrade - at least for speed. For memory its a long winded solution with the *promise* of fantastic performance.

I got cold feet over it though - and bought a used TT, which was configured *exactly* as I wanted (8MB RAM, 200MB HD, 19" Mono VDU). It wasn't cheap - but about what I was going to have to spend on the PAK3 in the end.

:-)

Roland.

Could it be possible to fit a Tiny Turbo 030 accelerator card for ST (68030 / 40 MHz, 32 kb cache RAM) to Falcon..? The OS (TOS 2.06) on the board should be removed, and probably some other things might cause problems, too - but are there principally any technical reasons to why any 68030 card with some cache couldn't work on Falcon - if it could be fitted correctly..?

If e.g. Tiny Turbo could be installed to Falcon, what kind of modifications and technical problems should one expect?

Tommi

5667. XBios Sounds in HighSpeed Pascal (How To)

I went looking for the DoSound material in Personal Pascal, but came
up empty. I did find some Sound_Demo example code in the old version 1
manual, which they dropped out (along with lots of other stuff) when
they doubled the size of the manual in version 2.

The Sound_Demo in Personal Pascal doesn't actually use the DoSound
routine, it uses Gia_Read and Gia_Write calls to manipulate the reg-
isters directly. To get the Sound_Demo working in HighSpeed, just
replace these two lines:

FUNCTION gia_read( data, register : integer ) : integer ; XBIOS( 28 ) ;
PROCEDURE gia_write( data, register : integer ) ; XBIOS( 28 ) ;

with these lines:

FUNCTION gia_read (data, register: integer): integer;
begin
gia_read := GiAccess (register, data);
end;

PROCEDURE gia_write (data, register: integer);
var
junk: integer;
begin
junk := GiAccess (register, data);
end;

You'll also need to add a 'Uses Bios;' statement at the top of the
program, and change a couple LOOP statements to repeats, but that's
the gist of it. I tested it, and it works just like the Personal
Pascal version did. None of this involves the DoSound routine.

Kim Andersen (Kim@dksoft.ping.dk) wrote:
>
> Have you tried the online help in HighSpeed Pascal?
> Normally it gives an example of how to use it.

Unfortunately, this is the _complete_ online help information:

Procedure DoSound( CommandPtr : Pointer );
Executes a block of sound chip commands.
```

If you really want to use the DoSound routine, keep in mind that it's an asynchronous player, that works from a command list. Here's a simple example:

```
program DoSound_Demo;
{Sound values from Compute ST, Dec/87}
uses
Bios;
const
Bells: array [1..31] of integer =
($00DD,$0101,$02E2,$0301,$04EE,$0500,$06FF,$07D8,$0810,$0910,
$0A06,$0B44,$0C48,$0D08,$FF64,$800F,$810A,$FF00,$FF64,$800F,
$810A,$FF00,$0A10,$FF64,$073F,$0A00,$0800,$0900,$FF00
);
begin
DoSound (@Bells);
end {program}.
```

Of course, that probably doesn't help you much if you don't know how to interpret the command bytes. Here's an expanded version, with some explanatory comments added:

```
program DoSound_Demo;
{Example "bells" sound values from Compute ST, Dec/87}
uses
Bios;
const
Bells: array [1..29] of integer = {load PSG registers}
($00DD,$0101, {set A frequency (LSB,MSB) = $01DD => 262 Hz}
$02E2,$0301, {set B frequency = $01E2 => 259 Hz}
$04EE,$0500, {set C frequency = $00EE => 525 Hz}
$06FF, {set Noise period (low pitch)}
$07D8, {set Control reg: 11-011-000 =}
{= enable C noise, A/B/C tones}
$0810, {set A volume = envelope control}
$0910, {set B volume = envelope control}
$0A06, {set C volume = constant 6 (max 15)}
$0B44,$0C48, {set volume Envelope period (LSB,MSB)}
$0D08, {set volume Envelope shape = falling sawtooth}
$FF64, {pause 100 ticks = 2 seconds}

$800F, {glide from 15...}
$810A, {...using reg10 (Volume C)...}
$FF00, {...by -1, to 0}
$FF64, {pause 2 seconds}

$800F,$810A,$FF00, {same glide again}
$0A10, {put C volume under envelope control}
$FF64, {pause 2 seconds}

$073F, {set Control reg: 00-111-111 = all OFF}
$0A00,$0800,$0900, {set Volume to 0 on A,B,C}
$FF00 {stop DoSound}
```

```
);
begin
{ may want to shut off keyclicks here (will kill sequence) }

DoSound (@Bells);

{ should delay here to give time to finish (~6 sec), or poll the }
{ Control register on sound chip until no channels are enabled. }
end {program}.
```

Here's some reference information on the registers in the General Instruments PSG sound chip:

```
Register Bits Description
$0 76543210 A Frequency (LSB) {actually 125,000/trueFreqWanted}
$1 xxxx3210 A Frequency (MSB)
$2 76543210 B Frequency (LSB)
$3 xxxx3210 B Frequency (MSB)
$4 76543210 C Frequency (LSB)
$5 xxxx3210 C Frequency (MSB)

$6 76543210 Noise period
$7 76543210 Disables: I/O, Noise, Tone (76-543-210)

$8 xxx43210 A Volume (bit 4 = use Envelope)
$9 xxx43210 B Volume
$A xxx43210 C Volume

$B 76543210 Envelope period (LSB)
$C 76543210 Envelope period (MSB)
$D xxxx3210 Envelope shape:
$D = 1-shot rising ($0 inverts)
$4 = 1-shot rising sawtooth ($B inverts)
$C = repeat rising sawtooth ($8 inverts)
$E = repeat rising triangle ($A inverts)

$E 76543210 I/O Port A
$F 76543210 I/O Port B
```

And here's a list of commands accepted by the DoSound routine:

```
$00-$0F = load register 0-15 with following byte value
$10-$7F = undefined?
$80-$81 = dynamic register modification
$80, $bb = load base value
$81, $rr, $ii, $ll = register, increment, limit
(runs register $rr from $bb to $ll, stepping by $ii)
$82-$FF = delay in 50Hz ticks, using following byte (0=stop)
```

> Any information will be greatly appreciated (and if you can tell
> me how to bring in sampled/digitized sounds I may even kiss you).

If you're going to make threats like that, I don't see how you can expect much help. ;-) But seriously though, there are probably

others here who could provide better information than I... just ask again, and leave Pascal out of the Subject line. Something like, "How to Play Samples using GiAccess?"

Hopefully, this will be of some help to you. Or perhaps to some of the millions of Pascal programmers working on the Atari <grin>.

After changing my desktop.inf file on my mega STe and moving some stuff around in the hard drive, it now bombs when I try to boot with GDOS on the hard drive, even if I auto boot nothing else or have any accs. It still boots from floppy, but the speed is ridiculous. Why would this have occurred co I have been using GDOS 1.1 for about 2 months now with no probs. Do I need an update? The same thing happens with DCStuffer; it will run from floppy but not hard drive.

E-mail with replies.

thanks a lot
Skip.

Ummm, well, it's basically just a CPU bus, I'm afraid, nothing special.
It just parallels the CPU pinouts. So the only book you need is a 68k
data book. If you want to add anything into it and need IRQ lines, then
you'll need to pick them up from the MFP (68901) along with some of the
useful address decode lines.

Cheers, Martin.

Zilog do a (very) full manual for all their SCC and ESCC devices and I'm
sure that AMD do as well, since they also make them. Zilog have offices
in most Countries (but can be hard to track down). You'll need the 8530
manual for the SCC and the 85230 manual for the ESCC.

> o Is there an MC68138? If so, what is it? ;-)

Ummm - well I've just scanned my current Motorola database and can't
find any reference to it - what did you think it is/was ?

Cheers, Martin.

> but (a) I don't seem to be getting a 5v down pin 2, the HD detect wire, and
> (b) someone mentioned you should have the Atari Ajax chip to use HD.

Are you getting any voltage on the HD select line ? - slap a 10k pull-up
or pull-down resistor on it to load it in case - though it should have
an internal terminator. Assuming you do have some voltage (after proper
termination), then stuff a Schmidt gate on it (HC14). Also, be aware
that some drives gate HD select with motor on, which means that if you
have a 2nd drive connected which is a 720, then you will have to further
gate your HD selcet line with DS as well.

If you have a 2nd drive connected, then unplug it - it may well be
grounding the HD select line on pin 2, thus preventing it from going
high as it should.

Also, depending on the drive mech itself, some have the capacity to
invert both the direction of the HD select and the polarity (such as
Teac drives). Make sure that you are actually setup for HD sel out and
active high on pin 2. The Atari unlike the PC has to be told by the mech
what type of disk is fitted, whereas the PC does this the other way
around with the HOST telling the drive mech what disk is actually in it.

Incedentally, this is STUPID!!! - on the PC, you can put in a high
density disk and then format it as a low density disk thus rendering it
useless (on early DOS versions) because the mech selects 500K data rate
and the host controller sends data at the 250K data rate - Trust IBM to
get it wrong.

> I can format, read and write 1.44mb disks under TOS 1.6 (not from the desktop)
> but I have a switch hanging out the back of the machine which I have to set
> when I want to use HD, because the HD detect doesn't seem to be working.

You have little choice if you want to use a 5.25" drive as there is no
detect mechanism on these - so don't throw the switch away yet!!!

Cheers, Martin.

Silica may be opening Atari shops in the UK but until they get their act
together and give SOME support to the people that phone/write with queries and
orders for kit thy wont get far.
As for ST Format has anybody else had troble with cover disks?
4, count them FOUR times this year I have had cover disks that had errors on
them. OK STF replaced them (on one occasion it took 2 months to come thru) but
this last month it was a 2 cover disk pack (+ "wonderdisk" for subscribers)
not one was there, yep all three missing! STF please get your act together or
you too will go the way of STU

5686. Ptermres GEMDOS call

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-24 16:46:20 UTC
From: molen002@telecom.ptt.nl
Message-ID: <molen002.2.0010C62D@telecom.ptt.nl>
Source record: 29617

Hello,

I don't know if this is the right newsgroup, but I'll try it anyway.

My question is:

I made a resident program which terminates with the Ptermres
GEMDOS call (works fine). My problem is that I can't find a way to free the
memory used by the resident program if I want to unload it. Malloc doesm't
seem to do the job. I've got a pointer to the basepage and I know the program
size etc....

Does anyone know how to do this??

Please reply with E-mail, because I don't check this newsgroup very often.

Thanks in advance,
Ids.

I've been informed that this "AV Protocol" has yet to be translated from German to English. Therefore it is not a trivial matter to implement it (we don't know German). Once it is translated, we will gladly take a look at it and see if it makes sense to implement it.

If I am wrong, I would appreciate someone sending us the documentation for this protocol, as we have never seen it (and before this, never heard of it).

I've actually seen one run once, at some Atari show in Vancouver many moons ago... It was kind of neat, running on this huge monitor, in full color, doing many crazy things at once. It was definately a near finished product, in a custom tower case, seperate R/G/B cables to the monitor...

It was a while ago, as I remember talking to Bob Brodie (I think, it was back when there was an Atari Canada) about the 16-bit PANTHER...

Neat stuff! Anybody got one they wanna give me?

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.

Use the appropriate decomompression program for this.
- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:
- mdir [CR] to show disk-directory/space left.
- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)
- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")
- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt dlist.txt"
- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

Networking-wise, you may be correct - my Linux box is stand-alone at
the moment, so I haven't any experience. But that it does exceptionally well.

ObTech: Any GCC/G++ cross-compilers for Linux, generating Atari code?

Have a look in the documentation to Gemini, and also the documentation with ST-Guide.

What language? - there are C examples with both of those docs.
I've also got it working in GFA 3.5 too.

>especially Mac fonts, ...)

Compo have C-Font which converts Calamus CFN's to GDOS fonts (about 10 quid).
Fonty (ST-Club, about 12 quid) lets you convert PS Type 1's to Calamus, then onto GDOS with C-Font.

Speedo is a proprietry font format - licencesed, so noone knows the format (ie no converters
that I know of).

Hope this helps,

It's not important how many chips there are on the SIMM:s. All 30 pin SIMMS with less than 120ns access time works if you don't have a 16MHz board in your ST.

You do not mention, which terminal program / zmodem (or other protocol) you use. What is the size of the receiver buffer?
By the way: the measurement of cps-rates is often not very exactly. You should measure the time manually, transfering the same file, with a download time larger than 2 minutes. If the zmodem writes directly to disk it is nearly impossible to reproduce exactly the same conditions for the next try.

> I know you can configure HSMODA04 to your own specs, but I can't because

Many english-speaking people are unable to read english! That is the only one explaination for such sentences I can find. In the text files there are mentioned abbreviations, you find in the texts displayed by setter.ttp. This seems to be "too high" for you?

Greetings, HS

>checking for the @ symbol. If this is indeed the case, has anybody
>ported a better version of finger to Mint? If not, what do I need to do
>to fix my setup?

The version of finger that comes with mintos works only locally. I have
a working version at home. I do not remember whether the fingerd ported
by Theo Jansen included a finger client or not.

> Also, when I try to finger my machine from outside, I don't get any
>output. The fingerd seems to run, and my HD is accessed, but no user
>information is displayed on the remote machine.

Look at the /etc/inetd.conf file: The should be an entry looking like:
finger stream tcp nowait bin /etc/fingerd fingerd

and the fingerd must be in /etc (or where the fifth entry of the above
line says).

I assume the /etc/inetd.conf entry points to a path where fingerd is
not located!

I'm currently working on a tos/multitos driver that will
allow hard drive partitions to be bigger than 2 Gigs by
replacing GEMDOS I/O system. The new limitation is
currently of 512 Gigs. This driver creates 32 bits FATs
and directory. It will include real-time file packing
(safe as files are kept separated). Full sector-size/
cluster-size configuration... And many many more
features. All the people interrested by this program
or who want to make 32 bits compatible programs
should e-mail me. All comments/criticisms welcomed.

5707. 2nd floppy drive on Falcon ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-25 16:49:23 UTC
From: am14@doc.ic.ac.uk
Message-ID: <38jcuj$76n@oak44.doc.ic.ac.uk>
Source record: 29638

Is-it possible to install a second internal floppy drive in
a falcon (I have a tower and power supply cables) ?
I tried to connect it in parallel, i tried all DIP
combinations and it's still not working.
Is there a special AJAX in the falcon ? (as there is
no external drive connector)
Details: the second drive is a compaq that works fine when
it replaces the first drive.

Antoine Martin.

> declare it globally and then use the label to access it.

move.w foo(a6),d0 beats move.w bar,d0 by 4 cycles on a 68000

where foo is a 16bit offset into the stack frame and bar is a 32bit absolute address.
Of course you should declace key variables to be register (if you're working in
C/C++). 16bit ints beat 32bit ints on 680x0 for x < 2 so try -mshort with gcc.

BTW I once tried to optimize some time critical C by putting by global/static
stuff in a struct and accessing it via a pointer held in a register so as to
use reg+16bit offset rather than 32 absolute addressing.

Unfortunately the gcc data flow analyser realized that the pointer was constant
and generated 32bit absolute addresses as an "optimization" :-(

>Amiga/Mac/PC disks.. I know conversion programs are out there on the net,

The good news is that you don't need a conversion program to read PC
disks on an Atari ST. If you format a 3.5inch DS/DD disk to 720K in a
IBM compatible PC, it _should_ work on an ST, too. Just copy the files
from the PC onto the floppy, put the disk in an ST, and copy the files
off again (or alternatively, just use them straight from the floppy).

Note that if you format the disk on the ST, it is less likely to work
with the PC than if you use the PC to format it.

Hope this helps..

Actually, I would pay money for one, regardless if there was software.
I collect old, antique, and oddball computers, and this fits right
up that ally, tho its a bit later vintage that what I mostly own

(my prize several years ago was a prototyped CP/M machine, all
handwired, about 20 or more modular boards, a hex keypad for
debugging, and in a rack over 4 feet tall)

I understand that there was more than 'a transputer', in that there
was the parallel processing machine, plus workstations that were
networked into the thing??

You could use the chunky to planar code from MGIF 4.4 if you want. It is
the fastest I've seen on the Falcon by a long shot.
In the normal 640x480x256 mode on the Falcon, my code can convert and
display a full screen in about 0.6 seconds!
That translates to 6-7 320x200x256 screens per second. :-)

Anyone who'd like to try out the latest working beta version of MGIF 4.4,
please email me. Lots of improvements have been made during the summer,
so if you have an older 4.4 version, you don't know what you're missing.
I had hoped to have v4.4 released by now, but there always seems to be
more things to add and improve. Once I get the latest GUI changes working,
I'll probably do a general release and start using smaller version number
increments. ;-)

MGIF 4.4beta, among lots and lots of other things, is a faster GIF loader
than TurboGIF 1.3 and as I mentioned above, the drawing speed is simply
amazing.
Since the DSP is not used for anything yet, MGIF should really fly on a TT!

>I've been informed that this "AV Protocol" has yet to be translated from
>German to English. Therefore it is not a trivial matter to implement it
>(we don't know German). Once it is translated, we will gladly take a look
>at it and see if it makes sense to implement it.

It's available in English as part of the ST-Guide archive. This is
available on HENSA.

Here's the relevant page:

The basic construction of such a message is:
buffer[0] = <Message-type> (e.g. VA_START)
buffer[1] = <Sender-ID> (from appl_init())
buffer[2] = 0 ('overlength')
buffer[3] = <Control-keys> (SENDKEY)
<Window-handle> (ACCWINDOPEN)
<Window-handle> (ACCWINDCLOSED)
<Window-handle> (DRAGACCWIND)
Pointer to path (Low) (STARTPROG)
buffer[4] = <Pressed key> (SENDKEY)
Pointer to path (High) (STARTPROG)
<Mouse X-Pos.> (DRAGACCWIND)
0 (all others)
buffer[5] = <Pointer to line> (Low) (STARTPROG)
<Mouse Y-Pos.> (DRAGACCWIND)
0 (all others)
buffer[6] = <Pointer to line> (High) (STARTPROG)
<Pointer to path> (Low) (DRAGACCWIND)
0 (all others)
buffer[7] = <Pointer to path> (High) (DRAGACCWIND)
0 (all others)

The following messages are recognised/used:
* VA_START: (0x4711)
APP -> ACC: "Awake from your sleep & start your work";
ACC -> APP: Perhaps AV_ACCWINDOPEN, after the window has
opened and any selected file has been loaded. If a command line has
been input and contains more than one argument, then everything
starting from the first space is be interpreted as the name of the
page to be displayed.
According to the AV-documentation all file names must be input in
capitals and with their complete path. In order to comply with this
and still allow for the fact that the called application does not
know where the hypertext is to be found, the special case of 'drive'
"*" has been implemented:

Inputting "*:\AES.HYP" causes ST-Guide to search for the file AES.HYP in all known paths.

A call using 'C:\AES.HYP appl_init' therefore loads AES.HYP and displays the page <appl_init> from it.

A call using 'C:\AES.HYP' therefore loads the given file and displays the first page from it.

A call using 'appl_init' searches for this concept in the file given in 'REF' and displays the matching page from the corresponding file.

* VA_DRAGACCWIND: (0x4725)
APP -> ACC: "A file has been dragged to one of your windows, here is the path". Following this the Guide loads the indicated file and displays it in the window. The complete access path must be given.

* AV_SENDKEY: (0x4710)
ACC -> APP: "A key has been pressed which I can't do anything with, you can have it". This makes possible the use of all keyboard shortcuts by the application, even if the ACC is in possession of the top window.

* AV_STARTPROG: (0x4723)
ACC -> APP: "Start up the program specified in this message with the (possibly) also specified command line". The Guide uses this message for executing SYSTEM instructions. With GEMINI you can specify non-executable files here also, when a suitable program for the given extension is searched for and started.
APP -> ACC: VA_PROGSTART, which will however be ignored by the Guide.

* AV_ACCWINDOPEN: (0x4724)
ACC -> APP: "I've just opened a window". Since the window's handle is also passed, this serves the purpose, among others, to extend window cycling of the main application to the windows of the ACC, or to report to the ACC when objects have been dragged to one of its windows (see VA_DRAGACCWIND).

* AV_ACCWINDCLOSED: (0x4726)
ACC -> APP: "I have just closed one of my windows". Counterpart to ACCWINDOPEN.

>which is faster.

Simple rule: register is faster than register indirect is faster than memory.
In your case, you're asking about the difference between stack accesses, which
are generally (register)+16 bit offset, against absolute addresses, which are
generally a 32 bit address. The stack variable reference will be faster by 4
cycles on a 68000, and save 2 bytes of memory at the same time.

There are of course exceptions to this rule; absolute addresses in the range
0000 - 7fff and ffff8000 - ffffffff can be accessed with only 16 bit addresses,
and GCC with the -mbaserel option will use (register)+16 bit offset for global
data accesses, thus making them as fast to access as stack variables. (As long
as your total data space is 64K or less.)

Yes, a 68010 works OK with TOS 2.06. I think you can also get far enough in
in the older TOS ROMs to boot ST-Minix, if you're so inclined.

>: Also the 68010 doesn't have an MMU unit, although unlike the 68000 it can
>: work with one. The 68030 actually has one built in, which is why VM is
>: available for 68030 machines.

Well, you couldn't use an MMU to provide VM on a 68000, but you could still
use it for memory protection, which may or may not be worthwhile to you. If
you wanted to do a lot of extra work, it's possible to manage VM on a 68000,
you just need to do a lot of decoding to determine what access causes a
particular page fault... You probably can't provide a full virtual machine,
as the 68010 & up allow, i.e., you can't emulate hardware register accesses.

5718. [HELP] Calling Devconnect returns <>0L

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-26 08:11:11 UTC
From: jhh@cwi.nl
Message-ID: <jhh.783159071@news.cwi.nl>
Source record: 29503

I hope there is anybody out there who's had experience using the XBIOS devconnect call, and who can help me out, because I've been trying for two evenings and can't figure out what goes wrong. Here's the story:

I wanted to write a very simple program to sample the mirophone into memory, on a Falcon 4Mb/65Mb. So I figured I use the DMA, which means I have to connect the ADC to DMAREC using devconnect(3,1,?,?,?). Now whatever I fill in for the last three parameters, devconnect returns a value unequal to 0L (typical values I do get here are 0x6, 0x600 or 0x6000: the 6 does keep coming up here). When I look at the memory locations the Falcon uses to configure the crossbar (something like 0x00ff8c30 and onwards I believe) I notice that the call indeed did not succesfully complete: when I switch clocks (i.e. parameter three), the new clock is not stored in the configuration registers.

For testing, I tried to connect the DMAPLAY to the DAC, i.e. I tried devconnect(0,8,?,?,?). This works without problems, and the aforementioned memory locations look fine too. So my question is: is there some secret thing I have to do first, before connecting the ADC to DMAREC?

Any help would be much appreciated, 'cause I'm desperate.

P.S: On a related note: does anybody know whether there are libraries and header files for Pure C that use the same naming for functions and structures as the Compendium does? I got very weird behaviour when calling 'setmode' which was only explained after I disassembled my source to find that PC writes 'setmode' for 'Vsetmode' and 'setsndmode' for 'setmode'. And I couldn't figure out why the hell a sound routine would mess up my screen:-)

T> If e.g. Tiny Turbo could be installed to Falcon, what kind of
T> modifications and technical problems should one expect?
T>
Jim Allen has stated that the tt030 could be used on the F030 'in the
future'. According to him it would require a interface adapter to the F030 and
a rewrite of some of the PALs. I cant remember what, if anything, would be
required to do to the ROMs.
I would suggest you contact him directly at j.allen27@genie.geis.com and
[or maybe its jallen27 - try both ;^)]
and get the scoop..... Jon

There aren't any Falcon specfic OS calls (or at least I couldn't find any)
Thanx anyway.

So my question still stands, does anybody have a list of all new Falcon

GEMDOS, BIOS and XBIOS calls. BTW I'm not looking for a hardware registers list
as I already have this....

Thanx..... Alan.

5723. MiNT NET On A FALCON ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-26 11:42:36 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <38lfbc$ijj@whitbeck.ncl.ac.uk>
Source record: 29504

Has anyone actually got mint-net to work on an f030 ?

I've been playing with it for a while now to no avail.
Localhost connections work fine (telnet, ftp, rlogin), but getting a slip
connection is beyond me.

I got rlogin working a bit - the connection to the other machine comes up,
and I am prompted for user name & password, but the session then appears
to hang (left it five minutes once). If I then start my comms program again,
the remote machines startup sequence is displayed in the terminal window.

What is the problem ? Does MiNT-NET still not work properly with the falcons
serial port? (MODEM2 (ttyb)).

Words of advice appreciated from anyone who has got a MintNET going on a falcon.

(Please)

Craig.

5724. Memory problem on ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-26 12:14:14 UTC
From: gest
Message-ID: <gest-261094131318@pubmac07.amc.uva.nl>
Source record: 29509

Recently my 1040ST started to give error messages like: error at address A0000 (the address is not always the same). The first step in solving this problem is finding the chip(s) causing it. The memory chips are labelled thus:

U3 U4 U5 U6
U10 U11 U12 U13
U18 U19 U20 U21
U22 U23 U24 U25
U27 U28 U29 U30
U34 U35 U36 U37
U39 U40 U41 U42
U44 U45 U46 U47

Could anyone explain to me how these labels correspond to memory addresses? Please, send replies by personal mail to: edwin@sara.nl

Thanks,

Edwin van Spronsen

5725. HELP! Floppy Drive dying!

5727. High Density Drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-26 13:44:11 UTC
From: emdu02@castle.ed.ac.uk
Message-ID: <CyA8tp.D43@festival.ed.ac.uk>
Source record: 29522

I am getting the "Desktopper" kit and was considering getting the Bitz high density drive controller and two internal high density drives. I was wondering how it works, any difficulties
and the wiring needed for the module and installing the high density drives. Will the second high
density drive work as normal, ie meaning high density with auto select.

Cheers, Alan.

: GEMDOS, BIOS and XBIOS calls. BTW I'm not looking for a hardware registers list
: as I already have this....

XBIOS 5 - L:log addr L:phy addr W:rez W:mode
Same as ST except when '3' is passed to rez. Mode has the same format
as XBIOS 88

XBIOS 88 - W:mode Returns Word Value
'-1' will retrun current mode. Any other mode value will change
rez. However, the VDI, phy, and log will not be changed with this
command.
Bit format XXXX XXXF SOPV 8NNN
F=Vertical flag. If set RGB=interlace VGA=double line
S=ST compat. if set
O=Overscan if set (RGB only)
P=Pal mode if set
V=VGA mode if set
8=80 column if set
N=bits per pixel 4=TCmode 3=256col 2=16col 1=4col 0=2col

XBIOS 89 - Void Returns Word
Returns type of monitor connected
0=STmono 1=STcol 2=VGA 3=TV

XBIOS 91 - W:mode Return Long Value
Returns the number of bytes a screen will use for a particular mode.
Mode has same format as XBIOS 88

XBIOS 90 - W:extern Void
This will tell the VTG hardware to use external sync.
XXXX XXXX XXXX XHVC
H=external horz. sync if set
V=external vert. sync if set
C=external clock if set

XBIOS 93 - W:index W:count L:array Void
Set colors by RGB value starting at 'index' for 'count' number of
times. RGB values are stored in memory with array being the starting
location.

XBIOS 94 - W:index W:count L:array Void
Get colors from pallete. Same format as Xbios 93

XBIOS 150 - W:andmask W:ormask
VsetMask is used to set the AND and OR masks the the VDI uses to
modify the color values for vs_color (opcode 14)

XBIOS 128 - void Returns Word
Returns '1' to show sound system is now locked.

XBIOS 129 - void returns Word
Returns '0' to show sound system is now unlocked.

XBIOS 130 - W:mode W:data
This command is used to get or set the following sound parameters.
if a negative number is used in 'data' then the current setting is
returned
MODE Discrption
0 Set or get left channel output (attenuation)
xxxx xxxx LLLL xxxx

1 Set or get right channel output (attenuation)
xxxx xxxx RRRR xxxx

2 Set or get left channel input (gain)
xxxx xxxx LLLL xxxx

3 Set or get right channel input (gain)
xxxx xxxx RRRR xxxx

4 Set or get ADDer information regaring
ADC, matrix or both. (One way to get Yamaha and
samples playing together.)
xxxx xxxx xxxx xxMA M=matrix A=ADC

5 Set or get ADC's input.
xxxx xxxx xxxx xxLR
L=Left --- If set, then PSG (Yamaha sound chip)
R=Right If cleared, then Microphone input.

6 Used for STE compatability. Uses STE prescale.
0=Divide by 1280 (invalid for Falcon)
1=divide by 640
2=divide by 320
3=divide by 160

XBIOS 131 - W:reg L:begaddr L:endaddr Returns Long
THis is used to set the play or record functions.
0=play 1=rec. Begaddr and endaddr set the buffer.
Returns '0' if no error.

XBIOS 132 - W:mode Returns Long
This is used to set record or play modes.
0=8bit Stereo
1=16bit Stereo

2=8bit Modo
Returns '0' if no error. I have been only able to record in mode 1.

XBIOS 133 - W:playtrk w:rectrk Returns Long
This is used to set the number of record or playback tracks.
Set values from 0-3. Values set STEREO Tracks.
Returns '0' if no error.

XBIOS 134 - w:monitortrk Returns Long
Monitor one of four tracks on speaker with this command.
Set values from 0-3
Returns '0' if no error.

XBIOS 135 - W:src_inter W:cause Returns Long
This is used to set which interrupt, if any, that will occur
at end of frame. If the frame repeat is on, this interrupt is
used to repeat sample.
src_inter 0=timerA 1=MFP i7
cause 0=none 1=play 2=rec 3=play or rec
returns '0' if no error.

XBIOS 136 - W:mode Return long
Used to control the operation of the play or record buffers.
xxxx xxxx xxxx LRKP
L=record repeat enable
R=record enable
K=play repeat enable
P=play enable
returns '0' if no error or current state if mode=-1

XBIOS 137 - W:dspxmit W:dsprec Returns long
This function is used to tristate the DSP from the Matrix.

dspxmit 0=tristate 1=enable
dsprec 0=tristate 1=enable
Returns '0' if no error

XBIOS 138 - W:mode W:data Returns long
THis is used to communicate of the general purpose I/O pins
on the DSP connector. Only the low order three bits are used.
mode 0=set I/O direction 1=read 2=write
data When setting I/O, a setting of 1 indicates output while 0
indicates input. Read op., reads the current state of GPIO.
Returns '0' if no error, or value read for mode=1.

XBIOS 139 - W:src W:dst W:srcclk W:prescale W:protocol Returns long
This function is used to attach a source device to any dest. in
matrix.
src Source device
3=ADC 2=extrenal 1=dsp transmit 0 DMAplay

dst A bitmap of dest. devices to connect source to.
0x8=DAC 0x4=external out 0x2=DSP recieve 0x1=DMArec

srclk The clock of source device.
0-25.175Mhz 1=external 2=32mhz

prescale Clock prescale
Sample Rate is Clock divided by 256 divided by prescale.
Only cetain prescales are available for DMAsound wich CODEC.
And the CODEC is only compatble with a 25mhz clock.
1,2,3,4,5,7,9,and 11 are valid for CODEC.
If set to '0' then prescale will be comatible to STE,
see Xbios 130

protocol Used to enable handshaking. (used with graphic or
commpressed data)
0=enable 1=disable

Returns '0' if no error.

XBIOS 140 - w:reset Returns long
Get status of CODEC. After call the DSP is trastated, gain and
attenuation is zeroed, old matrix is reset, ADDerin is disabled,
Mode is set to 8bit stereo, play and record tracks are set to 0,
monitor track is zeroed, Interrupts are disabled, and buffer operation
is disabled.

Status is send to a long word as follows.
xxxx xxxx xxLR SSSS
L=if left clip occurred.
R=if right clip occurred.
S=status bits 0=no error 1=invald control field
2=invalid sync 3=serial clock out of range.

++

There is a list of XBIOS calls specific for the Falcon for the Video and
Audio. There are DSP calls as well. If you need them as well, tell me
and I will post them too.

5731. ICD AdSCSI+ power cable

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-26 17:25:01 UTC
From: thopman@uoguelph.ca
Message-ID: <38m3dd$hgr@nermal.cs.uoguelph.ca>
Source record: 29515

I bought a used ICD AdSCSI+ host adaptor to cobble together a hard drive system. Unfortunately, I didn't realize until (much) later that the power adaptor for the board was not included. I think I can make one up myself, but I would like to kno if there's anything special/unusual I should know first. How standard is the power connector on the board? I know the +5/GND/GND/+5 is weird, but what about the physical connector? Can I go to any electronic supply store and buy one there? Also, how readily available are power connectors for SCSI drive mechanisms?

From: dbrewood@nest.demon.co.uk
Message-ID: <941026Z193242.462dbrewood@nest.demon.co.uk>
Source record: 29513

I'm considering buying (when I can afford it) a tower case for the Falcon, and installing within it my Apple CD-300 CD Drive, and the hard disk out of the MiniS (165mb), plus fitting to it the interface for an external PC keyboard (Dell extended, which I already have), and a lock kit, plus large support feet.

I am almost sure that this will involve a new uprated power supply, as well as other modifications, with maybe a fan added, is this correct?

Has anyone out there had any similar modifications done to their machines at all?

I've seen James Partners Falcon and that looks good and works well, although there would be a problem with his streamer working on it's side.

So, points of concern:

- Does the external keyboard interface include remapping of all the keys?
- Could the above be installed by a hardware 'idiot'?
- What problems could be encountered?
- Rough idea of price?
- Could any savings be made by using an old DEC Rainbow case?
- Would the Dell keyboard have a standard interface?

Any advise appreciated.

Hi.

If I bought a 16Mhz or 25Mhz accelerator I know the speed increase will help with Calamus, but will it also help in speding up the display of games such as Legend of Valour, Ishar 2 and 3, Elvira? You have to admit, on an standard STe (even with 4M ram) the update is painfully slow.

Thanks for any help.

Andy.

Yes, the final 1.11 version will be binary distributable. For the
1.11-BETA versions, Eric Smith had asked not to upload any source or
binary releases.

Hi Derrick,

Most drives are connected via a ribbon cable. The case on the Atari external drives forms an addapter between the Atari round disk drive cable and the usual ribbon cable. I replaced my original SS external drive (my only drive at the time) with a regular DSDD drive mechanism back in May. It works fine. Three things to note however:
- the new (1/3 height?) drive mechanisms are quite a bit smaller than the (Epson) mechanism Atari used in my SF354. The LED light and eject button are also shaped and placed differently on the drive. I cut a hole in the front of the drive case so that:
the disk slot would be accessible,
I could see the LED indicator, and
I could press the eject button easily enough.
I also put cardboard spacers below the screw holes to lift the drive up in the case a bit.
- On my replacement drive (a Teac, I believe), there are some VERY SMALL swithes on the back of the drive. I think these configure the drive to be drive 0 or drive 1 or ... and other such interface information. I had to adjust one of these (from d0 to d1, I believe) to make my drive work with my ST.
- The final point has nothing to do with connecting a new drive mechanism to the ST. Rather it has to do with using both a SS and a DS drive on the same system. Disks formatted as DS will not be readable with your SS drive. You will probably find that you use the SS drive only temporarily to copy files from one DS disk to another. My opinion, of course.

Good luck,
Emile

P.S.: If you are really interested, I will sell you the SS drive I now have left from my upgrading for $5 US + shipping (or $15 US, including shipping).

If they work at all at the higher speed, and some games don't, then I would expect it to update quicker in these games. Action games would possibly update more smoothly but probably not more often.

Mark.

For tosfs drives MiNT calls the code in the rom, and it is possible that the rom code is buggy. But on the falcon it should be OK (what TOS version are you using?). I never got MiNT 0.95 running satisfactorily on my Falcon, but I didn't have that problem.

BTW, I've just compiled MiNT 1.10h8, but whenever I try to boot with it it says the intro message and hangs. Why?

5744. Connecting F030 to PC

Newsgroup: comp.sys.atari.st.tech

Source record: 29526

I am wanting (just for hell of it) to connect an old XT PC to my F030. Ideally what I'd like to do is be able to open a term window (under Windoze 2) and have it connect to the F030. This would be like using a unix system where you sit at a terminal and can open xterms on another machine.

Is their any software which would allow direct connect and the ability to do this?

Rod

What's the modification? A while back a number of people wanted this info
as they (my self included) couldn't get the tapebios stuff to work.
Further, do you think this would work on an ST?

SCSI mechanisms take standard 5.25" disk drive power connectors.

The power cable for the board is a standard part AFAIK also.

> You have to admit, on an standard STe (even with 4M ram) the update
> is painfully slow.

Yes - but 3 points to note:

1) Not all programs like speeds above 8Mhz.
2) Because of point 1, accelerators often boot at 8Mhz, and you have to run a small program (normally in your AUTO folder) to turn them on. If you have a game which is on an autobooting protected disk it is very difficult to turn on the accelerator before running it. Some accelerators have hardware switches to get around this problem.
3) Some programs will not run correctly with an accelerator fitted, even if it is not turned on - due to the presence of a cache and/or other timing differences.

:-)

Roland.

T@(> I bought a used ICD AdSCSI+ host adaptor to cobble together a hard
T@(> drive system. Unfortunately, I didn't realize until (much) later that
T@(> the power adaptor for the board was not included etc.......

Hi, I have just bought an AdSCSI+ board (wonderful it is too, complete with battery backed up clock). The 'Power Adaptor' is not supposed to be included with the board, so you have not been ripped off. The AdSCSI board takes its power from the hard drive, or rather the hard drive power supply.

You should have a four wire connector about 6 inches long, with a standard four pin power plug on one end and a similar socket on the other. Splitting off this is a thinner, two wire connector that plugs into the AdSCSI+ board.

You are supposed to plug the hard drive power (supply) cable into the socket and plug the other end into the hard drive, thereby just taking a 'feed' off the main leads for the AdSCSI+ board. If you don't have this lead, I wouldn't worry, it should be very easy to just take the + and - supply lines to the AdSCSI board. If you don't have the lead and you want me to check exactly which wire goes where, let me know and I'll pop the case off mine and have a look.

Hope this helps,

Cheers.

Source record: 29534

Hi, First, thanks to everyone who replied to my post about the 3 chip SIMM upgrade. Now, another question.... If I get 60ns SIMMS, will my ST run faster than by using 100ns SIMMS ? I have heard that the greatest delays in a computer are caused by the CPU sitting around for years [relative of course !], doing nothing, waiting for the RAM to respond.

Just a thought.

Also, how much are SIMMS (60ns or 100ns) going for on the used market these days ? They are available in the UK [used] for around $40 US per Mb.
I'm sure they are cheaper than that in the US.

Cheers.
Kev.

As many Falcon accelerators are very cheap (and therefore also simple), I wonder it it would be possible to build one yourself..???

Saves money (if not nerves..) - and, let's face it - would be very interesting..! At least as long as your Falcon still works..

But:

What is needed to do, if you want to make F-030 run on 32..40 MHz? Any hardware switching possible between 16..whatever speeds? (a "turbo button" like in PCs)

How about bus-speed? As Falcon is said to be able to handle 18..20 MHz with little problems, why not do it? What needs to be changed - and what are the problems expected?

Somebody recently wrote that Falcon could handle more than 20 MHz, but the Blitter makes this impossible. I've heard that a German accelerator, Mighty Sonic not SEGA stuff ;-) disables Falcon blitter totally.

So, I let my imagination fly:

- Disable Blitter (no use anyway in normal use..)
- Switch bus-speed to 25..33 MHz

Well, folks. I guess this cannot be done. But why? Or has anyone ever tried it? I would expect RAM problems, at least - but the idea is interesting.

So, if those of you who really KNOW have any good ideas and experience, quite many of us would be willing to take the soldering iron - and start modifying our birds of prey... Even despite the risk.

There must be ways to speed-up the Falcon around - but few of us know them.

Thanks (in advance) for any interest and help !

Tommi

I would swear that I saw the exact adaptor you need at Radio Shack the other
day. I believe the power connector on the AdSCSI is the same as that found
on most 3.5" floppy drives. If that is true, any decent PC shop should
have what you need, with no fabrication required. All it does is pass-through
the standard larger power connector, and steals ground and +5. If all
else fails, I'm sure ICD would cheerfully sell you another one :-). As for i
the power connector on the SCSI drive, this is one of the few standards in
the computer industry. Just about everything uses those power connectors
(bigger floppies, IDE drives, etc. etc.), so buying them should be no
problem at all.

No. SIMM speed indicates how fast they could go and still perform properly.
The speed at which a machine uses its memory is determined by other things.
An ST will not push them past 120ns or so, I believe.

SIMM prices fluctuate constantly, but I expect around $20-$25US for used
1mbx9 SIMMs is probably pretty close nowadays. Check out
misc.forsale.computers to get a better idea (and a great deal on most stuff).

Actually, 120ns should work fine too. So its actually 120ns or less, or
less than 125ns. And a 16Mhz ST access memory just like an 8Mhz ST.
The bus is still run at 8Mhz. Only a Falcon or TT run the bus at 16Mhz,
in which case 60ns RAM would be optimal.

With MiNT-net you will be able to log in and run text mode programs on the Falcon displaying on the PC. I don't know of any way to get a GEM display on the remote machine. It would be theoretically possible to write a display driver for GEM to allow remote operation using an X terminal, but I've never heard of anyone doing this.

Mark.

5766. HELP: my HD crashed

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-28 11:03:23 UTC
From: hofman@nlev00.uni-paderborn.de
Message-ID: <38qlpr$634@btmplq.god.bel.alcatel.be>
Source record: 29449

Hello,

I have a MEGAFILE 30 which now has 10.000 bad sectors!
Reformatting does not work, even with a large bad sector list, because
the install utility which came with the MEGAFILE 30 writes the bad sector
list on bad sectors (?). I always get the message 'BAD SECTOR LIST CORRUPT'

I would like to replace the SCSI drive inside it with a large SCSI drive, but
i need some information for that.

My questions are:
- can I replace the old SCSI drive with a (very) large drive
- if not, what other possibilities do I have
- do I need any extra drivers when installing a (very) large disk

Greetings, Peter

5767. SCSI HD Slowing Down - Please Help

Source record: 29448

Hi There,

I recently purchased an ICD SCSI Link device and connected my old external 20Mb MacIntosh (Rodime) SCSI device, and it formatted (and subsequently worked) beautifully. I partitioned it as C:4Mb / D:16Mb .

What seems to be happening is that the more I put on the disk, the slower (and I mean slower) it gets in terms of writing files. Reading is still fine, no change, but writing files has gotten so bad, it's slower than floppy writing. The D: partition is about 9Mb full, so if its exponential, it will become almost unusable soon.

Any suggestions?

Regards
Dennis R

Look around for GHOSTLNK it uses the serial port and works pretty good,
BTW you set the ST side in the Control Panel, *NOT* in the program

The HD detect line on a floppy drive is OPEN COLLECTOR. This means that
when it's off it is connected to ground, and when it's on it is not
connected to anything. You'll need a pull-up resistor to get anything out
of it.
To put it simply, just connect a 1K (ish) resistor between pin 2 and 5V.

My internal 2.5" IDE when accessing F partition crashes SO often its a joke, you hear it stop then have to wait until it powers up again and continues making these awful noises.

What is this? Do I need a new HD? It is in good condition according to Diamond Edge though.... I'm confused!

An ATW contains a modified MegaST (with SCSI), from 1 to 13 T800s, and
a graphics card capable of 1280x1024x16 and various other resolutions
(the fewer pixels, the more colours, as usual).

It runs Helios (a un*x-like OS for MIMD multiprocessors) and the X window-
ing system: or at least it's supposed to, b*ggered if I can get X going
on mine. Once you have un*x+X, you have access to quite a bit of software
(possibly even more than exists for a TT 8^>).

But like I say, I can't actually get X to run...

Sounds like a problem with the power supply; check the connections as a bad connection may more or less work but with a high resistance making less power available; I had something similar on my ST (with a Power drive using the internal power supply).

>email here is hit and miss!

Last time I tried it didn't recognise the hostname.

Yes. You have TOS 1.0 or 1.02. Get TOS 1.4 or newer, and you will get rid of
these troubles. Until you upgrade your TOS, get fatspeed. I used to use
that back in the old days - before 1.4 was out. It is probably awailable on
atari.archive somewhere.

It does not have a SCSI drive inside - it's an old RLL drive.

>- if not, what other possibilities do I have

Replace the RLL drive. A friend of mine exchanged his 30 Meg RLL drive in
the megafile 30 with a 40 Mb MFM drive. It worked just fine as an RLL
drive. It still gives 60 Mb and no bad sectors.

>- do I need any extra drivers when installing a (very) large disk

I doubt you will find a very large RLL drive.

>I have come up with the following quiestion.

IMHO, you probably wont be running a full X on any atari, perhaps a
souped up TT or the new Medusa. Theres been arguements about this
before, but I am simply of the opinion that none less than a TT
can handle it. The falcon might have the balls with a 32MHz processor,
but damned if the video isnt hell. Yes, I own both a TT and a
Falcon, and the differences are night and day, and vice versa!

You could probably use it as an Xterm; ie running Xclients off a
server and displaying it on an Atari X machine.

No - as the the CPU clock is fixed at 8Mhz. Having faster SIMMs will help if you have an accelerator (though by how much I don't know). Also if you suddenly have to change to a PC, at least you should be able to put the 60ns SIMMS in it. 100ns are too slow for most modern PCs

Roland.

I compiled up to MiNT 1.04 without a Minix partition. I don't see why newer
versions wouldn't work either - though it has to be said that almost all
MiNT developers will have a Minix partition.

Roland.

Mine's hidden away behind a grill - but I must admit it looks like a 3.5"
disk power connector too. Only seem like 2 wires are connected though, +5v
and Ground.

:-)

5794. New version of CBZONE (B*ttl*Z*n*) for Ataris

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-30 23:19:45 UTC
From: rgivan@cix.compulink.co.uk
Message-ID: <CyIE4x.HC@cix.compulink.co.uk>
Source record: 29477

Some of you may remember a rough port of CBZONE I did for the Atari at the end of last year. A new version is *very* nearly for release, but I need some more tests done.

If anybody has a 68000 with I/O based FPU (68881/2) and would be willing a test a copy, then please *mail* me.

I believe the MST with SPF004 card meets this criteria - and also the MSTE with FPU chip.

Of course if nobody is interested in such a version - then I won't bother distributing it. The other 2 versions in the archive will be:

68000 - no FPU
68030 - Co-processor FPU

Between the 3 of them all Ataris should be covered - though perfomance on a basic ST is still very slow - hence the interest in FPUs.

Thanks

:-)

Roland.

@CiX

PS I need this testing done quick, as I want to upload the final versions this week!

>before, but I am simply of the opinion that none less than a TT
>can handle it.

It will depend VERY heavily on the graphics processing ability of the machine. So, just using the standard resolutions of the TT and Falcon, I would expect that you would need some ASM code to get a decent speed out of it, just as we need to run NVDI or Warp-9 now to get good speed.

Now, if you have accelerated graphics, such as that provided by the various graphcs cards now available for the TT (and Falcon?), AND IF those are supported by the X that you get running under Linux68K, then you can still get good performance from a slow machine.

I just compiled 1.10 without a Minix partition, altho I am sorta kicking
myself. I partitioned my drive as only one partition, and should have
made two of at least equal size. Oh well, maybe its time for an
external drive :-)

Speaking of minix filesystems, is it possible to run one full-time?

It happened. At 3pm this Sunday my hard drive crashed well and truly.
The F partition lost the majority of data stored on it (LOTS of new
graphics I had been working on :-(and some games). Teach me to make
back ups won't it :-(so I cleared out the whole partition and worked
the thing over with Diamond Edge, fixed everything, optimised it and got
things sorted. It would appear that has worked (for now) but I also
notice troubles spreading to E partition. This is NOT good, I use my
Falcon for a LOT of things and can't have the hard drive fail on me.
Does ANYONE know what the hell is going on please? I will check the
power supply, but it only fails on F and not on C or D. Suggestions
please... I can't afford a new HD.

5802. symbol table formats

Newsgroup: comp.sys.atari.st.tech
Date: 1994-10-31 15:03:04 UTC
From: slh100@tower.york.ac.uk
Message-ID: <Pine.SGI.3.90.941031145456.13268A-100000@tower.york.ac.uk>
Source record: 29483

Does anyone know the format of the symbol tables produced by C compilers such as Lattice C, Sozobon and Mark Williams C? I am considering writing a source level debugger by using a preprocessor to insert debug calls into the program before compilation, and really need to get at this information. In particular I need to know how to locate the start address of the symbol table data: is this in the program basepage somewhere? Also, do Lattice, Mark Williams and Sozobon all use the same format or are they all different?

Thanks in advance,

Shawn Hargreaves "God is real, unless declared as integer."

Apart from the obvious possibility that the drive is fucked, I would look
out for one other thing: The cable to the IDE drive is unshielded, and
is susceptible to interference. When I added a FalconWING and SIMMs to
my machine, I could no longer access the IDE drive or floppy. Adding
shielding around their respective cables fixed the problem.

If you are using minixFS .60 pl <10 you can't run MULTITOS on
the Falcon. You need at pl 10 which got rid of the update-daemon
and uses addroottimeout instead.

To use addroottimeout you will need at least MiNT 1.10 h4
(better get h9 or 1.11h2)

Sounds to me like it could be your PSU, ie. it can't supply enough power,
shuts off and then takes a while to come on again.

I have had (have) this happen with a hard drive.

> atleast what I should be looking for...

I think there are a number of SC1224 models that this description could match, but if it is like mine this could be useful. I had one with a front mounted pushbutton (parallelogram shaped). It did what you describe a couple of times, then gave up the ghost completely. I opened up the unit, directly connected the two wires leading to the switch (effectively making it "on" all the time), and used a power strip on the floor to turn it on and off. This was not very elegant, but it worked fine for several years.

Two comments:

1. It might not be your power switch. If not, good luck.

2. Death warning! Death warning! Monitors have parts in them that can hold a lethal charge for quite some time, even if the unit is unplugged. Be extremely careful when working on the guts of any CRT. If you don't know what you are doing, have someone else do it (who does :-). I managed to shock the shit out of myself with a monitor that had been unplugged for about a week. I was lucky I put that work off for several days....

5810. Line A programming in Heat & Serve/Sozobon C

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-01 12:24:52 UTC
From: lunman@ChamplainCollege.QC.CA
Message-ID: <395c2k$6rk@samuel.ChamplainCollege.QC.CA>
Source record: 29392

Hello. I was wondering if anybody could tell me how to do a Line A call in Sozobon or Heat & Serve C. I know that Line A is not particularly in fashion anymore, but I have a need for it anyways.

To be honnest, I'm not quite sure what Line A really is. Is it a kind of system function call (like gemdos, bios, xbios...) or is it some kind of specific memory location one has to access with pointers? I know the mouse status can be affected by it, as well as many other lowlevel things.

The main reason I need it is because I have LINEA.H which defines all kinds of macros as being 'offsets' from Line A. One of those macros (actually two) returns the position of the text cursor on the screen. So I know the offset from Line A, but I don't know Line A itself!

If anyone has a clue... Thanks!

Jon

k> course !], doing nothing, waiting for the RAM to respond.
100ns SIMM are fast enough for a stock ST_E_ ..... if you have a
STF, and an upgrade that uses SIMM, I have no idea if faster ram would be any
help, but I doubt it [accelerator boards are another story]

k> Also, how much are SIMMS (60ns or 100ns) going for on the used market
k> these days ? They are available in the UK [used] for around $40 US per
k> Mb. I'm sure they are cheaper than that in the US.
k>
By the time you consider shipping etc, I doubt there would be much
diffeence. 100ns 1meg SIMM might be sold for $25-$30 each in lots of 4, 60ns
would be around $40 US.

It's even simpler than you think. You can modify a programs RSC file
without ever needing to touch the original source code. The program
reads the file in AFTER it has started running, not during compile time.
But, make sure you stick with only changing text, not other items such
as the number of menus available. THAT information IS read in at compile
time, and unpredictable things WILL happen.

From: f91-men@filsun15.nada.kth.se
Message-ID: <395pc6$m8a@news.kth.se>
Source record: 29399

What is the fastest way to (portably) detect that a key has been pressed?

I don't like calling BIOS in the inner loop of my terminal emulator. I've tried comparing the head and tail pointer of the keyboard iorec, but I get strange results (although it works for input from the serial port).

Do I have to intercept keyboard interrupts in some way, and how?

Source record: 29401

Jon Lunman (lunman@ChamplainCollege.QC.CA) wrote:
: Hello. I was wondering if anybody could tell me how to do a Line A call
: in Sozobon or Heat & Serve C. I know that Line A is not particularly in
: fashion anymore, but I have a need for it anyways.

Yea... it line a stuff writes directly to memory, so the screen
isn't abstracted at all, therefore you'll have to consider all the different
ST displays if you want the program to run on all the machines.

: To be honnest, I'm not quite sure what Line A really is. Is it a kind of
: system function call (like gemdos, bios, xbios...) or is it some kind of
: specific memory location one has to access with pointers? I know the
: mouse status can be affected by it, as well as many other lowlevel things.

line a is a processor "feature" of the 68000. basically, there are
no instructions that start with the hex number A. for example, there is no
instruction $A000. now, what happens when the processor encounters an
instruction word that begins with A? it "traps" or it jumps to an address
corresponding to "line A exception" ... just like if there is an interrupt,
it jumps to the address of the interrupt handling routine. with line a,
it also pushes the "invalid" instruction on the stack. for example, it would
push $A000 onto the stack and then trap. what Atari did, and Apple,
for that matter, was to use this "feature" to extend the operating system.
in a way, this adds $FFF "calls" or macros to the operating system, since
you can go from $A000 to $AFFF. atari, as you know, used it for screen
drawing primitives.

: The main reason I need it is because I have LINEA.H which defines all
: kinds of macros as being 'offsets' from Line A. One of those macros
: (actually two) returns the position of the text cursor on the screen. So
: I know the offset from Line A, but I don't know Line A itself!

the offsets of the macros are just that, offsets from the first
line A instruction, that is, $A000. so each macro or each line A call can
be envoked by inserting $A000 + offset as an instruction word in the program.
(in your header file, you'll have the offset #defined, so no problem there).
now, to actually "call" line A, you need to ...

```
asm {
dc.w 0xa000 + offset
}
```

or you can make a macro out of it...

```
#define LINE_A_TRAP offset asm { dc.w 0xa000 + offset }
```

and all you'll need to do from now, is

```
[...C code...]

LINE_A_TRAP INIT_LINE_A /* INIT_LINE_A is an offset in your header file */

[...more C code....]

: If anyone has a clue... Thanks!

hope this helps. by the way, there is also line F!

: Jon

5822. for sale or trade

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-01 18:42:24 UTC
From: boyd@hardy.math.fsu.edu
Message-ID: <39626g$t5n@mailer.fsu.edu>
Source record: 29403
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

For sale or trade:

Below are a bunch of ST items I want to sell or trade. For buyers, highest reasonable offer gets the item, with preference going to those that buy more than one item. Shipping will be negotiated with the offer.

As for trades, let me know what you have and we may be able to work something out. I am looking for joystick extension cables (preferably the short paired type, to defeat the ignorant location of the joystick ports on 520/1040ST), games, scanning equipment, Stereotek 3D glasses, working Wico bat handle or Ergo joysticks, European ST magazines (ST Action and ST Review particularly), Pagestream 2.x font disks, and probably lots of other stuff. Cash can make up for deficient trade material from either party. Shipping will be negotiated with the trade (though for trades, I often suggest that both parties eat the shipping). Don't be shy, send me some email and let me know what you have to trade.

Oh, another thing I have particular interest in is a joystick similar to the standard Sega/Nintendo "joypad" thingies (left thumb controls movement via an 8-way "pad" rather than a stick, right thumb for fire button). I believe there is a joystick sold in the UK called a "Boolistik" or something similar that seems to be exactly what I am searching for. Let me know if you have one available, for trade or just some cash!

All of the items below are original commercial products owned by me. Unless otherwise noted, all original boxes, manuals, and disks are included. I have cheats for some of the games, and will include them with the sale/trade.

Please reply via email.

****Application and Utility****

Tempus v1.x, excellent text editor, not as good as Tempus II, but no slouch either. Blazingly fast (hence its name), even on a box-stock 8mHz system. Designed for programming, great for general editing as well.

TurboJet, Neocept, fast GDOS print driver for HP Deskjet and Laserjet printers, includes a bunch of 150 and 300dpi fonts. Claims to be 200-500% faster than other HP drivers (for that time, I don't know if there are faster ones out now).

Image Cat, Wizworks, v1.0e, this program catalogs all kinds of image files (.img, .pi1, .pi2, .pi3, .pc1, .pc2, .pc3, .tny, .neo, Macpaint). It makes "summary" or "thumbnail" sheets which have the images on them (reduced), with file name and directory information. You just point it at a directory and it prints out the images. This is great

for DTP folks with a lot of clip art. Printer drivers for SLM804,
HP Desk/laserject, NEC LC890, Panasonic KX-P4450, Epson LQ and FX.

Microsoft Write for ST, buggy WYSIWYG word processor, the only Microsoft
product ever made for the Atari that I know of, includes a full
copy of Atari GDOS. Can be run from floppies and a ramdisk (Jeez,
did I really do that? I must have been really patient back then :-).
I managed to produce a bunch of papers and letters with it using only
a floppy and color monitor, so it is usable, though certainly not
state of the art.

CAD 3-D v1.0, Antic, original disk accidently laundered (don't ask :-),
includes original docs plus backup floppy. This is not really for
architectural design (i.e. Dynacadd or Autocad), but to make nifty
3D animations for fun.

****GAMES (Arcade Action)****

Alien Syndrome, overhead view scrolling shoot'em up, lots of fun for two
simultaneous players. Plenty of fast and furious shooting, lots
of weapons, little droids that follow you around and help you out,
big ugly aliens, etc. Great game.

Captain Fizz Meets the Blaster-Trons, Psygnosis, sort of like a Gauntlet II
in space, best with two simultaneous players (screen is split to give
each player their own view). Overhead view, destruction galore.

Baal, Psygnosis, Excellent platform/adventure game (mostly arcade action).
Future setting, sideways scrolling, large sprites, good guns. This
is a pretty hard game, but lots of fun.

Sidearms, Capcom, scrolling sideview shoot'em up, mouse controlled, lots
of weapons and powerups. Good "mindless destruction" game.

Enduro Racer and Crazy Cars, combo pack, no docs, Enduro Racer is a cross
country motorcycle racing game, Crazy Cars is a racing game. Both
are OK, though quite old.

Super Cycle, Epyx, no docs, oval track motorcycle racing.

Eliminator, strange driving/shoot'em up game, lots of different weapons and
bad guys.

Frostbyte, Starsoft, side-view platform game, I would recommend it for a small
child (in terms of its difficulty). A bit boring for us big children,
IMHO.

President Elect 1988 edition, SSI, presidential election simulation, graphics
are quite lame (mostly text, in fact), but I suppose a political
process fan might like it. It does not appear to be particularly
tied to the 1988 elections, and has data for US elections all the
way back to 1960. Can apparently be used to predict elections as
well.

****ST Action Magazines (with coverdisks)****

Issues available: 26, 43, 50, 51, 53, 54, 55, 56, 57.

These mags are great for game fans. The reviews help one avoid poor games and select good ones, plus there are cheats for the games, how-to-play guides, and useful non-game relaterd articles (hardware reviews, expansions, etc.). Also, they all have a "best ST games to date" list in them, which is a great way to select the "best of the best" when game shopping (for example, from discount houses who only list the names of the products, with no descriptions). Finally, the cover disks that come with the mags provide demos of games (so you can try before you buy), plus full PD/Shareware games and other software. Most come with two disks.

Also available: three ST Action binders, each will hold about 12-14 issues without any damage or modification (wire-in-the-middle style) and make it convenient to leaf through the mags. Sold/traded only as a group. These are well made, nice looking binders with the ST Action logo on them. Will hold any of the large format UK magazines (A4 size, I think).

> Details: the second drive is a compaq that works fine when
> it replaces the first drive.

Yes, it should be, the problem is that you need to select drive, which
you can do by connecting a pin from the PSG-chip to the drives.
The method you have tried does not do this, and therefore selects both
drives at the same time, and ofcourse it fails...

Looking at my multiboard manual, that came with my Lighthouse Tower, the
correct PSG-pin to use is pin 19.
And the correct drive-pin is 10 for Ataris.
Remember that the drive becomes active on a LOW signal!
It is necessary to make a small circuit that inverts the PSG-pin 19
output for drive B.

There is another solution that allows you to have 4 diskdrives, but that
is somewhat more complicated.

Hope this helps you out!

regards Tommy

Good luck!

Is it particularly worth it though? I know IDE drives are cheaper than SCSI
but not by nearly as much as they were. Also it could be a lot of effort
when complete host adaptors cost under 100ukp. Are you going to write your
own hard disk driver as well?

:-)

From: ab364@FreeNet.Carleton.CA
Message-ID: <CyM74B.HCI@freenet.carleton.ca>
Source record: 29413

Help! My father-in-law's ST 1024 won't talk to his modem. The alleged RS232 cable is plugged into the modem port, allegedly an RS232 port, but there is now way to configure the port from the menu bar. This, even though there is a menu item specifically for that purpose clearly displayed in an illustration in his manual. STalker just sits 'til it disconnects, it says it's dialing, but his Modem's "off hook" light never lights up. I suspect it's either the port (unlikely) or the cable. But what do I know -- I use an IBM clone? I've tried everything I can think of and have yet to connect. Do you think maybe the store that sold him his RS232 cable is Atari ignorant? Help me help my father-in-law hit the road, er...the information highway.

5831. RE: ST won't talk

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-02 03:00:11 UTC
From: talbote@wc5.wl.aecl.ca
Message-ID: <2NOV94.03001142@wc5.wl.aecl.ca>
Source record: 29417

Hi Andrew,

I don't know anything about STalker but I do have a couple of suggestions for your father-in-law to try out. As you are already a user on the Ottawa Freenet, I'm sure you already know much of what I'm saying here but here it is anyway.

1) The ST Owner's Manual shows a menu item allowing the configuration of the serial port. This is in fact only present in the desktop menu if a particular desk accessory is present on the boot disk. I think this desk accessory is provided by a file having the name RS232.ACC. Most terminal emulators have built-in options (commands) allowing you to configure the RS232 port without using the desk accessory.

2) Some of the terminal emulators I have tried out on my ST have more than one window but only one is used to type things directly to the modem. This can certainly be confusing if you are not aware of it.
Instead of using an automated dialling feature in STalker, first try to get your modem to respond to the simplest AT (Attention) command. In the window which talks directly to the modem type

at

If your modem and terminal emulator are on speaking terms, the modem should respond with

OK

Beyond that point, issue the command

atdp XXX-XXXX

to dial XXX-XXXX (on a pulse line). By the way, if STalker or your modem defaults to tone dialling and you only have a pulse line, there will be a problem.

Anyway, those are my suggestions for what they are worth. I think the RS232 (modem) port on ST's are fairly standard (that is, identical to PC RS232 ports). I haven't had any problem with mine. I should mention that for early ST's, there are Serial Fix programs that allow the port to work properly at the higher speeds (up to 19200 bps). I have such a program in my AUTO folder but I must say I have not noticed any improvement since I use it. Noisy lines are still noisy.

Come back for more info if your father-in-lay continues to experience problems.

Emile

>A simple question can I connect an IDE drive to an stfm?

SS sell an adapter that lets you put one in a mega. This presumably would work in the stfm but there are two problems - you might have a lot of soldering to do as the stfm doesn't have the bus in the mega (does SS's card use the bus?) and you'll never fit the drive in the case. But theoretically yes, you can connect an IDE drive.

>somewhere?

I don't think gemdos normally loads it. It is tacked on the end of the
executable and one of the fields in the program header tells you how long it
is - see gemout.h if you use lattice C. The actual symbol table format is not
completely standard - DRI set a de facto standard which was limited to 8
characters per name, which is why Lattice C uses it's own format. However I
think Lattice's is basically similar. I'm sure I've read documentation for the
formats somewhere, I can't remember where at the moment.

I don't think that was what he meant. Linea0 is an initialise function which returns the address of the linea global data array. These macros use offsets into that array.

You can't really avoid it if you want to do it portably. Using iorec is not a good idea even if you can get it work and intercepting keyboard interrupts is even less portable.

If you are using MiNT, you could try an Fselect to wait for rs232 or keyboard input, this also stops you from having to poll, so making other applications more responsive while you are running.

I don't have any documentation, but it's a font selector. Drop it in your auto folder and one or two programs will use it to select your font and rather more than one or two will bomb unexpectedly. There is another UFSL compatible font selector which is better and more compatible, but until more programs support it I wouldn't bother.

You don't need docs to use it, if you want to write programs to use it there is documentation available, probably in an archive with the program on aaue somewhere.

I don't see what is wrong with using iorec - I do it with no difficulty whatever. All that the Bios function is going to do is to compare the head and tail pointers, but it wastes a lot of cycles in the process.

5844. 2 serial ports on Falcon

I have an urgent need for a second serial port on my Falcon. I know that it's possible to add one to the MFP. What I don't know is HOW to do it.

Are there any instructions available? Commercial products?

Also, would it be possible to use the LAN-port as a serial port by building an adapter? Would the SCC be able to run both of the ports simultaneously in different speeds?

From: larserik@oslonett.no
Message-ID: <398j0j$pq5@hasle.oslonett.no>
Source record: 29414

I've been using the harddisk driver in SCSI-tools junior 6.02 for some while, but when I bought a SCSI-interfac I got SCSI-tools 6.06 full version and installed that harddisk driver instead. BUT the disk test both in the junior and full version says that the full version is slower:

```
Driver version: | SCSI-tools 6.06 full | SCSI-tools junior 6.02
------------------|----------------------|----------------------
Large block read: | 749 K/sec - 750 K/sec | 950 K/sec - 966 K/sec
Small block read: | 204 K/sec - 204 K/sec | 400 K/sec - 407 K/sec
Average seekrate: | 22 ms - 24 ms | 18 ms - 19 ms
```

I've tested several times with both drives and with both version's disk test routine, but the junior version is aways much faster !!! On small blocks it is almost TWICE as fast - Any explanation ????! In my opinion a full version should be faster than a small version

One easy thing to do is switch the left and right buttons. It requires a
bit of soldering, but it is no big deal. Also, you can put a small blob
of hot glue or epoxy on the end of the little "stick" that actually pushes
the button, so it pushes it a bit harder. I would recommend the button
switch.

I have no idea if this will work, but I think the LAN port is just like the
Appletalk port on a Mac, so a Mac modem cable should allow you to just plug
a modem into this port and give it a try. Just an idea, proceed at your
own risk!

You could always try getting the data-sheet for the Zilog 85C30 SCC from
ELFA's data-sheet faxservice.

Most signals needed should be available from the LAN-port, but if there
is a pin or two missing, a data-sheet would be nice to have!
(ELFA faxservice: 08-735 35 33 follow instructions, sweden only)
The part number for the SCC is: 73-757-36

Another thing you could do, is to use the MFP.

Good luck!

Regards, Tommy

>>MiNT developers will have a Minix partition.

The MiNT source only uses 8.3 filenames, so you shouldn't have any trouble
compiling it. And yes, since the Minix filesystem has so much better
performance, I'd bet that most developers are primarily on Minix filesystems.

>I just compiled 1.10 without a Minix partition, altho I am sorta kicking
>myself. I partitioned my drive as only one partition, and should have
>made two of at least equal size. Oh well, maybe its time for an
>external drive :-)

If the partition isn't completely full, or rather, is mostly empty, you can
always doctor up your boot sector and shrink the first partition, creating
an entry for the second. Obviously not an operation for the unassisted or
faint of heart... (The TOS/DOS filesystem allocates space pretty linearly,
so if you haven't used it a lot/caused fragmentation on it, you can probably
just truncate the partition with no data loss. You need to truncate the FATs
as well, but it's simple to do if you already know what the entries in the
boot block mean.)

>Speaking of minix filesystems, is it possible to run one full-time?

Full-time? A filesystem would be precious little use if it decided to
automatically unmount itself after a few minutes, eh? You always need the
first partition on your first hard drive to be a bootable TOS partition, if
you want to boot off hard disk. I suppose if you didn't mind booting from a
floppy, you could make the entire hard drive into Minix partitions, but that
would be silly. Besides, almost all your loadable drivers and such also need
to be loaded from the same directory as the boot disk.

>Hi, I am sorry if I missed this, but any reasons for using Minix system
>while having MiNT installed?

It's generally faster although reading a directory either from ls or in a
desktop window seems slower. It allows long filenames (up to 32 characters)
and you can have large partitions without waste (in theory; I'm not sure how
it works on the ST).

> and if I would like to try it, how to set the size of the partition?

You make a normal partition of the desired size, then run minit. I can't
remember what the option is, but one of them lets you specify the
maximum name length and you do want to change that as the default is
only 14.

5857. Re: 2 serial ports on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-03 12:13:23 UTC
From: s002893@YPSERV.rz.fhtw-berlin.de
Message-ID: <39ak53$7v@RW320B49.rz.fhtw-berlin.de>
Source record: 29300

The MFP ("MODEM1") of the Falcon is only usable as 3 wire interface (GND, RXD, TXD). Some of the extra lines (RTS/CTS...) which are used by STs are used for the printer port of the Falcon (Yes!).

A instruction is in the MFP_X.TXT in the HSMODA04.LZH archive at a.a.u.e. (but only in German)

The LAN-port is supported by HSMODA04 drivers only in a limited way, without handshaking (or software handshake = XON/XOFF). The next version (HSMODA05-package) will support "RTS/CTS" (it is DTR/CTS) too, usable with a apple modem cable which allows hardware-handshake.

Greetings, HS
PS: HSMODA05 will be available in some weeks.

5860. [FAL] Monitor question - RGB vs VGA

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-03 13:15:27 UTC
From: sanders@sci.kun.nl
Message-ID: <Cyp0tr.98q@sci.kun.nl>
Source record: 29304

Hello,

A quick question for monitor guru's. I'm about to purchase a MAG
17" multisync, and I discovered that it has separate RBG BNC connectors on
it. So can I use it with a Falcon->RGB adaptor? And will I *finally*
be able to use those TC resolutions and run all those lovely demos?
If yes, howcome? It's the same monitor anyway, so why couldn't those
demos run in the first place?

In short: What is best for me to do; connect it via the standard
VGA plug or buy an RGB adaptor and use those separate connectors? Are
there any restrictions (i.e. can an RGB do everything a normal VGA
could?) I use BlowUP Hard I (internal) BTW, that's why I'm going for
a bigger monitor in the first place :-)

Are there some sorts of RGB/VGA switchboxes so I can use them
both, if neccesary?

Thanks for any thoughts,

Sander SToks

: Details: the second drive is a compaq that works fine when
: it replaces the first drive.

: Antoine Martin

Yes, it is possible, since I have one. The desktop uses it normally
as drive B. So the software is all right (TOS 4.04, that is), but the
hardware sucks. Atari simply "forgot" the drive select 1 signal which
selects drive B.

There was an article in a german magazine (ST-Computer from 1/94 I
think) regarding this problem. They showed a little hardware-hack,
which I tested, and it is working! I don't have any problems with
my two HD-Drives.

If someone is interested in details, just leave a note:

George,

Deskpic does support color pictures but it will only run in color
if you are running in color (makes sense kind of) you therefore need to make
sure the gif is 1. in color and 2. your resolution you are runnning in is
in color.

Re: sizes, you can use commercial programs or pd software to
resize the image to fit your screen (not recommended in general though)

Actually, Gulam is very nasty when run under MiNT. Ive had it severely
crash my machine, and had to press RESET, even tho alert.acc caught
the error.

Bash is quite nice. I used to use ksh, but it seemed to have some evil
bugs in it (or at least the version I was using, 04 or 4 or something
like that). Most functionality of ksh is in bash anyways :-)

The desktop would recognise any SCSI device so long as there is a driver
for the device - AHDI for hard disks, MetaDOS for CDs, etc. However, I
think it is a waste of time. You may as well get a Syquest or MO drive.

Something similar happened to my mouse about a year ago. The poor beast just
got sicker and sicker, until the left button worked no more.
I'd suggest getting a new mouse. They're not really that expensive, and once
you get a new one, you'll be amazed at the difference (particularly as most
available mice have a higher resolution than the old Atari blocky mouse)

Beware, the Megafile 30 and 60 have an RLL controller. Your MFM drive
will probably not work reliably with such a controller.

What if any standard is the Falcon Lan port?

Would it be possible to connect this to serial port on an XT PC and
still get a 250k transfer rate?

As I indicated in a pervious post I want to be able to:

Open a window (term) on the PC this window can then
be used to run text applications on the F030.
(I would like to be able to use various term
windows at once)

I would also like to get it so the F030 acts as a server
which at the request of the PC will connect to a remote
BBS system and shunt the data to the PC in the background.

Any suggestions welcome.

I've been using a new mouse for a few years and it's obviously better than the Atari brick, even with a mouse accelerator. The 'Rolls-Royce' of mice is supposed to be the Naksha, but I have to say that when I tried one I was unimpressed, so I wouldn't be too picky BH.

To get a really impressive mouse I'd really recommend getting an Optical one. No rollers to trap dust and smooth as anything. I got an Alfa-Data optical from Golden Image for 25ukp a while back and would never switch back.

The only disadvantages are that you have to use a special mouse mat, so no rolling it around on your jeans or a tabletop, and the mat has a tendency to bubble up for some reason.

>are PC-emulators on an ST520/1040 compatible with a pc...

Not in all things. For instance you may expect problems with
communications via modem. The hardware-differences between a pc and the
serialport of ST's are almost impossible to overcome. For instance
pc-emulators like PC Speed do not support the communication ports. AT
Speed also not, for the same hardware reasons.

5879. C++ Library and header files

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-04 18:57:29 UTC
From: coutu@mv.mv.com
Message-ID: <CyrBBu.G8w@mv.mv.com>
Source record: 29312

Having established what seems to be a sound Mint environment with gcc
2.5.8 and the C++ processor I thought I was all set to start learning C++.
Wrong! The libraries and header files are missing!

So before I go off and snarf the files from the Gnu ftp server I thought
I'd ask if anyone has already built these for use on the Atari?

There's actually only one reason, why I don't do multitasking on my F030,
that's because I dislike all the Unixshells under MinT. They are all huge
and slow. Gulam is nicely small, fast and doesn't need a bunch of external
programs. Yes its very flawed, but when you use it its very responsive,
and sufficiently comfortable.

I would like to use my Falcon as a console for a DEC RT-11 that I am developing some software for. I tried using a term program (Storm) that supports VT100 emu, but have not gotten it to work yet. What kind of cable do I need to plug into the console port? A Null-modem, or regular serial cable?

And will Storm be able to act as a simple console, or will I have to do something else?

Thanks,

Russ

From: m8885@abc.se
Message-ID: <CysF8o.53L@abc.se>
Source record: 29321

I have an an Ultra Speed Drive 42 MB from Hard & Soft (Germany), it's a Quantum SCSI-disk with an ICD host adaptor, bought in 1990, connected to my 1040 STe. Now I"ve managed to get hold of a second hand IBM SCSI-drive, 166 MB, 14.4ms. The problem is that my system won't recognize it. I've tried with SCSI-tools.app, ICDFormat.prg, AHDI, but no response from the disk. I've tried to disconnect the old hard disk, but it doesn't help. I have no manual for the IBM-disk. I know I should remove the terminators if I use the new disk as first in the row and so on. I can't find anything else to change on the disk, no jumpers as far as I can see. Do I need a separate controller? Or doesn't it work at all with Atari?
Can anybody help? At least with the (email)address to Hard & Soft. Or ICD. Or anything.

Yngve Andersson

I'm working with two floppy drives in my falcon.

A = Drive-Select A (low active)
B = Drive-Select B (low active)
C = Motor On (low active)

_______ A C | B
_ -------
B = A & C 0 0 | 1
0 1 | 1
1 0 | 0
1 1 | 1

TOS 4.04 will regonize the second drive.

5892. Q: Cumana OSK v2.3 and Atari STE ('E')

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-05 17:24:34 UTC
From: paulseniura@delphi.com
Message-ID: <h+03jDS.paulseniura@delphi.com>
Source record: 29325

Hi,

I presently have an expanded Atari 520ST (akin to a Mega-ST4) which is working (mostly) fine with Cumana's OS-9/68000 v2.3. It's just for a hobby right now so I can't even consider to afford to upgrade.

I am considering buying a Mega4-STE from another Internetter, but I really must know if my copy of Cumana OSK will work on it first. It's the hardware changes and 'new' gizmos on an 'STE' model (i.e. the 'E' stuff) that I think will prevent OS-9 from working on it. But I could use & write drivers for the dual 8-bit DMA sound ports etc. if stock Cumana OS-9 v2.3 will work on it (not to mention adding hi-rez graphics via the VME buss B-)).

Second, I'm still needing info whether GESPAC's 'G-Windows' is available for *any* of the ST(E) models capable of running OS-9. Reccoware's prices for a complete 'MGR' package (Atari-ST monochrome mode only), run-time and development libs, are in the neighborhood of US $800 give-or-take. That's totally way out of line for us hobbyists hackers, and no one's made me any other offers (such as third-party 'discounts').

I really need some facts. If you can help me figure these out or tell me who to call or e-mail, I'd appreciate it.

Teac make a SCSI floppy drive, model FD-235JS806.
This is a 4Mbyte SCSI floppy (2.88 Mbyte formatted).
It's actually an assembly of a Teac floppy with an add-on SCSI controller.

Omti make SCSI Floppy controller boards (model 3500 springs to mind).
This can control two 1.44 mbyte floppies.

I have not seen any PD drivers for these type of floppies, maybe ICD can
supply?

Well, the put_pixel and get_pixel commands work on my falcon - and those are
the only ones I find useful anyway. The overhead of using v_pmarker to plot
points is ridiculous. Using $a001 after getting the screen parameters from
the vdi seems a good option. I don't know about display cards though.

As others have alresdy mentioned, there are a number of PC emualtion packages available.

Most should be able to run DR GEM on the PC under some sort of CGA emulation as it ran ony my CGA compatible IBM PCjr years ago.rs back...

Most of the available emulators are hardware based and usually require soldering to get them running in your ST. Most haven't been sold in a while and software and tech support may be poor.

You can buy new CGA & HD equipped PC-XT turbo clones for approx. $100 US - about the same or cheaper then what the ST PC emulators can cost used!

You're probably better off going that route anyway for what you need to do.

Ari

You will need a 1.4 meg drive to format HD Disks, the Atari drive is not able
to format HD at DD standards, you need more output from the R/P heads in the
drive for HD disks...

So any one that states that you can Format HD disks does not know what they are
talking about..

Some disks might format but they will fail later....

k > There are plenty of uuencoders for the ST. I have ESSDC60.PRG,
k > from a BBS. It is probably at atari.archive at umich, and HENS

Hi,

I just picked up this ESS program, it works VERY well indeed.
Seeing as you have it, I"m just wondering if you have been able to
take say.. a UUencoded picture that is in three parts, and combined
them into one and uudecode it with this program?? I have converted
the encoded verison of a SINGLE file, but not of a multiple file.
Can you shead any light on this for me?

Thanks Brian.

5903. Speeding up the FPU in TT

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-06 12:03:42 UTC
From: jornm@oslonett.no
Message-ID: <39igmu$hkf@hasle.oslonett.no>
Source record: 29334

In one of the later issues of the german magazine 'ST- Computer' there is a description on how to increase FPU speed. It's very simple and it works.

I first tried with 40 Mhz, and the FPU realy ran 25% faster. As the FPU stil stayed cool, I got brave and tried 50Mhz, and it worked too. 50% faster. Still the FPU is relativly cool (< 40 degrees C.) so I might go for 60/66Mhz if I can get my hands on a 60/66MHZ XO.

The speed increase was measured with a simple loop calculating sin(x), where x is increased in small steps 10000 times.

If anyone feels like trying to do the same upgrade, be ware that YOUR FPU might not tolerate clock speeds as high as mine does!!

****

How to do it:

There is a FPU clock frequency selection named W101 (strap-type of switch), which selects 16 or 32 MHZ. It's located near the FPU on most revisions of the motherboard. It has 3 pins, and the middle one (no. 2 that is) is the clock input of the FPU. Just ad a XO close to the FPU and solder it's output to pin 2 of W101.

Finaly, the cheapest source for an XO is to get an defect or old PC motherboard (typical a 386 motherboard) and solder out it's XO. (Who said those PC's couldn't be used for anything serious:-)?

Use your Lan Port, works great!

Pin 3, 4 (gnd) and 5 are needed (see your Falcon030 manual for numbers)
and with the Fastserial cpx module it's easy to remap this port and set
the baudrate.

See also the other message from Harald Scheutzow.

I believe that a 386 Emulator Card for the Falcon is/was due out.
Has it arrived yet?
What is the price?
How does it work? Do I simply switch the machine on and click on
an icon labelled 'PC' or something?
Also what kind of performance is currently available?

5908. MiNTnet & Demon

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-06 15:06:36 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <784134396snz@bigbox.demon.co.uk>
Source record: 29230

Is anyone out there running a demon (Demon Internet Services) account using MiNTnet instead of KA9Q-NOS? Am I right in thinking I'll need an SMTP and NNTP package for it (and if so, where would I find one)?

Please mail any help to me as I can't seem to get news from demon to my system.

I also asked on this group earlier about MiNT 1.11 and MiNT 1.10h8 problems, before I found I couldn't read news. If anyone knows the answer to this problem could they mail me instead of/as well as posting to c.s.a.s for the same reason?

Thanks. (Soon I'll get this configuration file right...)

Unfortunately the Video Key by Practical Perripherals is not produced
any longer and no other company that I know of decided to make one.
unless there is such a device being produced in Europe, but I havn't seen
one advertised by anyone in the UK Mags.
I am also searching for one, so we will have to keep our eyes peeled for
a used one. (hope I beat you to it) <g>

Eva

BTW if you want the features of this product, I still have an original
box here to quote from.

5910. Falcon Speeds (ram etc)

> Obviously I can't go on like this.

Well a new PSU is all I can think of.

Is it only happening with F:?

The problem I had was that it was ok with just the HD but when it was
accessing both the floppy and HD (file copying say) then it 'shut down'.

> : You're not having much success with your email are you.
> Tell me about it :(most gets through and still lots bounces.... humph!

Now let me guess, the uni aren't doing much about it.

Yes, look in Gnustuff/Tos/G++ directory for gpinc20.zoo and
gplibo20.zoo at atari.archive.umich.edu or its mirrors.

You should be warned though... C++ is *very* tight in only 4M of RAM (I
have lots of code that won't compile in that little RAM), and its pretty
slow on an 8Mhz ST.

5913. PSION Series 3

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-06 21:12:04 UTC
From: Steve.Morley@saxon.seuk.com
Message-ID: <d99_9411071720@seuk.com>
Source record: 29340

Anyone out there successfully use remote link (3-Link) for the series 3
(or 3a, or any other Psion for that matter), with the Atari ST?

I know you'd need to write you own S/W for the ST end, but someone
might know of the existence of such S/W...I bet you can't get hold of
any info about the remote link protocol without buying the dev. kit. (or
does that omit this info also?)

Anyway......my experiences are as follows....

Can establish remote link, downloading server s/w to the psion using the
Atari ST....YES IT CAN BE DONE.....but it's not too fast....here's how..

Get hold of a copy of 3-Link (PC Version), and for the ST PC DITTO (the
software version does the job!). Then follow the 3-Link instructions using
the DOS installation procedures.....BUT....

You'll need a second FD drive, OR a HD in order to run the installation
from drive A to the other drive (C: or B: or whatever!)....

Alternatively, you can construct a floppy work disk manually by inspecting the batch files
to see what they do to construct the workin g copy...

If anyone's done this. or has any other method...let me know....

Steve Morley

It will fail on graphics cards, will only work with 16 colors or less,
and will likely fail under MultiTOS, and may screw up with screen acclerators
or other enhancements, or future machines.

Why are you using pixel-by-pixel screen calls anyway? At the very least,
make a bitmap in memory, in device-independant form, and bit-blit it
with vro_cpyfm(). And in some cases there may be an even better way.
Never use pixel-by-pixel graphics. There has GOT to be a better way.

>Speed also not, for the same hardware reasons.

PC-Ditto seems to access the modem just fine. Some day I'll write my own emulator, but I don't have enough time at the moment to even think about it. However, emulating the hardware won't be all THAT difficult. Any program that uses a fossil driver or the BIOS can be emulated pretty easily. However, most programs do go direct to hardware, and detect the modem by sending some data and polling the IRQ lines to see where the modem is. These practices make emulation very tough, but not impossible.

Hi all,

Anyone out there tried to upgrade to TOS 2.06 by using any of the doc files out there which explain how to wire the new chips in without buying an upgrade board. If anyone has done this and has had success please let me know. I tried one method and it didnt work for me. Also a friend tried the same one and his didnt work either. The TOS chips are fine, so it's not blown or anything and the Mega still works with the old TOS.

If you have a file explaining the way you got it to work please mail me the info.

Thanks

Paul

Not much, the main difference is that it is faster and more reliable. Also it should PC compatible floppies.

>Are there any key commands that I should know about ? All I know at
>present is that the escape key re-logs the current directory, but that
>existed in 1.2. How do I move files for example ?

Hold down control.

I'm not sure whether it works in 1.4, but in TOS 2.06 you can do a copy and rename by holding down alternate and a move and rename by holding both.

They're pretty compatible, and GEM is surprisingly usable (whereas if you can get windows to work at all it would be unusably slow). The emulators generally have an option to emulate a Tandy screen, which at 640x400 mono is obviously ideal for the STs display; I'm not sure whether GEM supports it though; you might have to use hercules, which would mean a gap at the bottom and horizontal scrolling.

Universal Font SeLector.

All the ones I've seen either can't handle more than about 10 fonts
otherwise they crash. Pathetic. I'm reliably informed the user
interface is also dreadful, but I've never managed to get that far
(I've about 80 fonts installed ATM.)

It is a good idea, but badly implemented. Delete it.

>of a Falcon (using PureC/BGI)...

I don't have the manuals in front of me, so I can't give you exact details, but Vsetcolor() is an Xbios call to change the palette; IIRC it takes an array of three bytes for red, green and blue and a colour index.

A better way would be to use GEM, the vs_color() call works in all palette modes of the Falcon as you would expect.

For true colour mode you obviously don't need a palette, although here the vdi call vs_color maintains a set of 128 'pens' which determine the colour of anything drawn in future, but do not affect what is already on screen.

5928. Motion Video, DSP Texture Mapping & Image Rotation

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 10:52:07 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <39l0sn$4j1@whitbeck.ncl.ac.uk>
Source record: 29256

I've designed & build a video digitiser for my Falcon, which can do
25fps real time video to the screen. I'm now working on a bit of image
manipulation software (hopefully to do some projection work for light
shows at raves & stuff). I'm looking to improve my effects performane
by using the DSP to map the image into different shapes in real time.
Doing a ball & cylinder is OK using CPU, but trying to then spin the
cylinder (NOT around the circular axis) is just to much for the CPU
(rememder that I'm still playing the motion video video from the camera
into the mapped image).

Any demo coders (I'm sure I've seen it done) who can point me in the right
direction will recieve my heartfealt thanks.......

Craig.

>I know which event it sends, I kind of figured out the pipe name, but
>I don't know what to do next!

It's quite complicated, you basically send down the pipe info on what types of
data you can receive and then will be sent the data. I suggest you read the
atari compendium.

> Also help for iconifying is needed. I can't get that iconified
>window to its proper place.

IIRC:

```
wind_get( wh, WF_ICONIFY, &ix, &iy, &iw, &ih ) ;
// Get icon position
wind_set( wh, WF_UNICONIFYXYWH, cx, cy, cw, ch ) ;
// Remember old position
wind_set( wh, WF_ICONIFY, ix, iy, iw, ih ) ;
// Iconify
```

>points is ridiculous. Using $a001 after getting the screen parameters from
>the vdi seems a good option. I don't know about display cards though.

The solution I found is to use NVDI's off-screen bitmap. You can draw in
the background and update the 'real' screen when you want.

If that means I can use the LAN port on my Falcon to Zmodem files to my
Mac _reliably_ then this is good news.

>Wrong! The libraries and header files are missing!

>So before I go off and snarf the files from the Gnu ftp server I thought
>I'd ask if anyone has already built these for use on the Atari?

Yes, you want to get mintlibs pl44, which are in

ftp://atari.archive.umich.edu/atari/Mint/Lib/mntolb44.zoo
ftp://atari.archive.umich.edu/atari/Mint/Lib/mntinc44.zoo

Although they are called mintlibs, and will support Mint if it is installed,
they are not exclusively for Mint and are better than the standard GNU
libraries (although they can result in bigger executables)

5933. ATARI ST SF314 DISK screwed up???

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 13:28:19 UTC
From: Slawo <slawo.wesolkowski@waterloo.ncr.com>
Message-ID: <CywG38.zB@attwat.Waterloo.NCR.COM>
Source record: 29267

I have a problem with loading anything from my SF314 disk. When I boot up the computer, the drive seems to fnction. However, when I click on the icon it tells me that there is nothing on the disk. Smae with the "show info" option form the file menu. In fact when I tried formatting something, it did ok until the lafew seconds or so: then it made some very strange noises and told me that it could not acces the disk. Also when I try to create a folder on any of these disks it tells me that "the application cannot find the folder you specified."

Can anyone help? Do I have to buy a new drive?

Thanks in advance.

Slawo

5934. Re: SLIP software available?

Newsgroup: comp.sys.atari.st.tech

In article <HINSENK.94Oct31234619@cyclone.ERE.UMontreal.CA>
hinsenk@cyclone.ERE.UMontreal.CA "Hinsen Konrad" writes:

> Is there any SLIP software for an Atari ST/TT under TOS? If yes, where?

It all depends what you want. I am using KA9Q-NOS which is a single TOS-based application which you run while you are online. It allows ftp, telnet, smtp, nntp, finger etc. but I haven't found any gopher or WWW support (but I've only had it two days...)

If you have the harddisk space, MiNT net is a more complete implementation of TCP/IP. It allows SLIP, PPP (in early stages) and a custom parallel port SLIP called PLIP for ST->ST networking. It currently has clients and servers for ftp, tftp, telnet, ntalk, finger, ping, gopher, WWW (lynx) etc. Because MiNTnet actually is an OS extension (extended device for MiNT) instead of a single application it is much more flexible and is growing very quickly. On the down side it is a lot of work to set up and is fairly large.

Both these programs are currently TOS only (ie no GEM interface).

5935. Re: Why Minix?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 15:55:08 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <784223708snz@bigbox.demon.co.uk>
Source record: 29272

In article <397vj8$h3a@hermod.uio.no> yichena@ifi.uio.no writes:

> Hi, I am sorry if I missed this, but any reasons for using Minix system
> while having MiNT installed?

Long filenames, full set of unix attributes (access permissions, access/
creation/modification tims) support for hard and symbolic links (sort of
like having a file on the disk in two places, but only using up the disk
space once), faster access times (I think), and that several MiNT programs
require it.
It does have a few problems with the built in GEM desktop and file selector
though - you won't be able to see the long names, and because it assumes files
are all uppercase, using the file selector under a program in the MiNT domain
or passing a file to a program in the MiNT domain doesn't work.
IMHO it's worth it though - just get MFSFM as a file selector and keep an eye
out for a Minix FS compatible desktop.

> And if I would like to try it, how to set
> the size of the partition?

It will wipe an entire hard disk partition, and (usually) work out the sizes
automatically. Note though that you can't boot off a Minix partition.

5936. QWK formats

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 16:15:39 UTC
From: bd@st-andrews.ac.uk
Message-ID: <39ljrb$d76@calvin.st-and.ac.uk>
Source record: 29261

Hi.
I'm trying to write a new QWK program. I've taken a few QWK packets to bits to try to find out exactly how they are constructed. I know what each file does, eg. the .MES and .NDX files, but there are a few bytes I just cannot figure out.

Rather than try to explain this, does anyone know where I can get detailed documentation on the contents of these files.

Also, When most QWK files are downloaded, they are packed. I know how to call dearchivers from inside my program, but how do you either stop, or redirect to a window, the status messages that programs like STZip and LHarc put on the screen while de-archiving.

Any help is greatly appreciated...

Thanks,

Brian Duff (bd@st-and.ac.uk)

5938. Booting older TOS vers. from disk??

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 16:54:12 UTC
From: georg@dali.nlp.physik.th-darmstadt.de
Message-ID: <GEORG.94Nov7175412@dali.nlp.physik.th-darmstadt.de>
Source record: 29260

I got a STE with TOS 2.06 and now have problems with some of the older
applications, which won't run on this TOS, but did with TOS 1.2.
I have a stoneage TOS 1.0 on disk, which fixes the problem, but I hate
the look of the icons and there are some problems with the harddisk.

Is there a way to create a boot disk from a ROM TOS or can I get
somewhere a bootdisk with TOS 1.2

Thanks for listening,

Georg.

5939. Drivert/Divert?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 17:57:45 UTC
From: dhbutler@magnus.acs.ohio-state.edu
Message-ID: <39lpqp$snm@charm.magnus.acs.ohio-state.edu>
Source record: 29262

Hi, I've searched high and low for a program called either 'Drivert' or 'Divert' that supposedly will allow me to switch drives A & B through software. My problems with drive A have now made it impossible to use the NeoDesk 4.0x to 4.04 patch because it (of course) insists on having a disk in drive A (arrgghhhhhhh!-). Apparenly a program called pchrome was supposed to have this program with it (or so I was told), but no such luck in the two versions of pchrome I downloaded... BTW, thanks to all who have helped with this problem in the past. Maybe I'll have to break down and do the hardware mod instead, but I prefer a software solution (of course).

So, could some kind soul please tell me where, and by what filename, to find this software? Thanks!!!!!!

Toodles!-)

Well, it works. How much more do you need to know? :)

Seriously, as far as Atari emulators go, the Gemulator seems to do a
very respectable job of it as long as you remember that it IS an emulator
and is seldom as good as the 'real thing', IMHO. I'm not knocking it.
That's just a fact of life.

You will want the fastest PC you can get for it, in my mind that means
a 486-33DX or better. I last used a Gemulator on a 486-66DX2 and that
was OK but even so it was still a bit slow or quirky on some operations.
I'd love to see it on a speedy Pentium machine, though. :)

Do NOT buy a Gemulator if your primary desire is for games or MIDI. There
is no MIDI or joystick support yet (AFAIK) and many games won't work at all.
Compatibility with most Atari software is very good, otherwise.

As far as TOS ROMs, the Gemulator let's you install multiple TOS's and
select which ones to boot with. I'd go with TOS 2.06 ROMS if anything.

For the latest info, contact the developer directly at the email address
darekm@microsoft.com. I'm sure he's made some enhancements since I last
chatted with him.

5943. GEM Clients for MiNTnet

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 21:19:08 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <784243148snz@bigbox.demon.co.uk>
Source record: 29275

While MiNTnet is fine for people who have a good knowledge of Unix and text based applications, it leaves a lot to be desired when it comes to user-friendliness.

I suggest that we organise a group of programmers to rectify this. I'm not suggesting that we do away with the text based system as it is necessary for working under window managers and so on, just that we develope an alternative set of clients that run under GEM.

What is needed:

ftp, telnet, ntalk, ping, www browser, smtp, nntp, finger and a control program to handle setting up PLIP, SLIP and PPP connections etc. A nice GEM based installation program that sets everything up without lumbering the user with unnecessary source code etc. Obviously we'd need to check with the original programmers that they didn't mind us doing this.

I have never programmed GEM applications using GCC, as I have always used Lattice but I am about to try and write GEM based versions of ping, finger and ntalk (because they're easy :-).

Could anyone who is interested in joining in or who is already involved in doing something similar please contact me?

Oh, and does anyone have a copy of netdb.h? I can't find a copy anywhere but all the sources I've looked at need it.

Thanks,

5945. CFV: comp.sys.atari.programmer

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 21:42:27 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.programmer-CFV1@uunet.uu.net>
Source record: 29266
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

FIRST CALL FOR VOTES (of 2)
unmoderated group comp.sys.atari.programmer

Newsgroups line:
comp.sys.atari.programmer Programming on the Atari computer.

Votes must be received by 23:59:59 UTC, 28 November 1994.

After this CFV appears on news.announce.newgroups it will be sent to
the mailing lists lexicor-list, gem-list mailing list, gem-magazine.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Siu <ysiu@lexicor.com>

CHARTER

Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

HOW TO VOTE

Send MAIL to: voting@qualcomm.com
Just Replying should work if you are not reading this on a mailing list.

Your mail message should contain one of the following statements:
I vote YES on comp.sys.atari.programmer
I vote NO on comp.sys.atari.programmer

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

One vote counted per person, no more than one per account. Addresses and votes of all voters will be published in the final voting results list.

5946. Patching MiNT To 1.11h2

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 22:44:45 UTC
From: michrm@central.susx.ac.uk
Message-ID: <39makt$m7j@infa.central.susx.ac.uk>
Source record: 29269

I have been able to patch my MiNT source to 1.11h1 ok, but I cannnot for the life of me patch to 1.11h2. I have never had any probs before with it. I have had to patch loosely (-l switch) most of the time. Could this be it?

I used the patches that go from 1.10 to 1.10h8 or something then 1.10h9 and so on to 1.11h1. Any ideas? Cheers. When I try to patch I get alot of hunk failures and then I run out of swap space or some such. Any help appreciated...except wait for the binary distribution!

Michael

Hmmm, video digitizing, I've built a digitizer some months ago. It's an external thing which does 512x256 in true color (24 bits). My biggest problem is how to get the data out of the digitizer buffer (3x 128k static) into my TT. I now use the printer port but it can only do about 100k/sec. How did you connect the hardware to the computer ?

Gert

BTW, my digitzer 'grabs' a frame in realtime also...

5948. Magazine Blow Out Sale!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-07 23:33:25 UTC
From: Mark Santora <santora@delphi.com>
Message-ID: <J+5U771.santora@delphi.com>
Source record: 29270

ATTENTION:

Prepare yourselves for the BIGGEST MAGAZINE BLOW OUT you've ever experienced!

PLEASE NOTE: Each magazine is for sale as a SET ONLY. I will not break them up.

FOR SALE:

Electronic Games(2600, Intellivision, Coleco)
-this is the Original folks! I have sparadic copies of this mag and I am looking to only sell them as a SET.

EGM(current)
-what can I say except I have them mixed from when they were bimonthly.

Atari Explorer
-the sparadic inhouse atari mag. mixed issues.

ST Log
-Analog's ST mag.

START
-Antic's ST mag.

Current Notes
-The hands down BEST Atari mag, ever. Written by users for users.

ST USER (European)
with disks

ST FORMAT (European)
with disks from issue #1!

ST ACTION (European)
with discs

STARLOG
Since Issue 35 to about 2 years ago. Good to excellent quality.

There are more still burried in my basement, I will add to the list as I find them...

If you are looking for specific issue numbers, write me back and I will email you specifics on each mag. This is an AUCTION. I will update it weekly for the the 3 weeks! This auction ends on November

31st.

5949. help! dead 1040ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-08 02:02:28 UTC
From: billbb@crl.com
Message-ID: <39mm7k$nvl@crl5.crl.com>
Source record: 29271

I gave my computer - illeterate friend my 1040 ST
that I had not been using for 2 years. Now it is
dead. He was using it, & it worked just fine.
He shut it off and it will not turn back on.
I hate to have him take it to a computer store
to get it fixed as he might be better off buying
something new?
Are there some simple tricks to try before giving up?
The fuse "looks good".
the circut board is all silvery except for 5 points -
3 of which are in a line near the 'heat sink'
& 2 of which appear to be attached to a small black thing.
We tried different cords & different outlets.

He did have the keyboard on its side to look at the
serial number while it was turned
on, but that shouldn't do anything?

It is so embarrassing to give a gift and have it break
inside of 2 weeks.

thank you for any help.
Please feel free to either mail me e-mail or post.

5950. TOS 1.2 able to run Cubase 3.11?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-08 08:31:32 UTC
From: ruokamo@ouhw11.nmp.nokia.com
Message-ID: <39nd14$4q1@noknic.nokia.com>
Source record: 29277

Does TOS 1.2 run latest v. of Cubase? I heard there might be some problems.

Please, reply ASAP.

Ari Ruokamo, Oulu, Finland

eMail: ruokamo@ouclu.nmp.nokia.com

: Steve Morley

There is a better way, and it is ALREADY done:

Get a copy of s3tost.zip (f.i. @hensa)
It is a transfer prg for ST and S3(a).
It GEM GUI and two windows (for St and S3(a))
You can copy/transfer, print, delete.... just with drag&drop!!

Great program! Thanks to the author. (It's not me)
I found it yesterday and I don't want to miss it anymore.

: Is it only happening with F:?

Well after TWO major crashes and lost data I back-up everything (that was left), formatted the hard drive and tried again only to find that HDX had gone and reformatted to the same bloody config as before. The problem is that the drive is a Conner 80meg but HDX sets it up for an 85meg which is no use and you can't set up HDX to your own preferences. This is NOT good!

>out.

Sorry I can't help you on that, I've seen detailed docs before but I didn't
keep them.

BTW You don't need the .ndx files at all.

>Also, When most QWK files are downloaded, they are packed. I know how to call
>dearchivers from inside my program, but how do you either stop, or redirect
>to a window, the status messages that programs like STZip and LHarc put on
>the screen while de-archiving.

To stop them altogether. you redirect stdout to a file, remembering to
duplicate the original handle so you can restore it. That's easy, getting it
to go to a window is rather harder. What you could do is show it in a window
after the archiver quits, if there is an error.

Hallo folks !

Some days ago I bought some original Atari-power-supplies.
I think, these are british one's.

The have the following parameters:

input 240V AC/50 Hz 38 VA
outputs 29V AC/600 mA
8.6V AC/1 A

Is anybody here who could tell me where they could be from ?

Please reply to : belitz@genesis.informatik.rwth-aachen.de

cause I 'm normally not reading this group (I'm from the 8-bit section, but
noone could help me there)

5960. MiNT-Net and POP-servers

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-08 15:51:10 UTC
From: der@discovery
Message-ID: <DER.94Nov8165111@discovery>
Source record: 29287

I'm about to setup a small network of computers (a MSTE and a Falcon to begin with). The network will run MiNT-Net and MiNTOS. My intention is also to make the network poll a POP-server every few hours or so. Unfortunately my knowledge about POP-servers equals zero and I need some help. I can't find any information in the MiNT-Net distribution, so anything would be appreciated.

Also, to make things even worse, I would really like to be able to offer dial-in SLIP service on my network for those unlucky ones who don't have Internet-access. This would include setting up my own POP-server so that others could use for example "Chameleon" on the PC to call me up and fetch Mail and News.

If anyone has any experience and would like to share it, or if someone knows where I can obtain some information I would be very happy.

Thanks in advance!

- Daniel Eriksson, der@astrakan.hgs.se

5964. Connecting a tape drive

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-08 17:13:21 UTC
From: v892544@si.hhs.nl
Message-ID: <CyyL69.4JB@si.hhs.nl>
Source record: 29290

I laid my hands on a pretty old tape unit. It has a 50 pins connector like
a SCSI connector, but my atari cannot communicate with the thing.

The drive itself is a normal height (1 inch). It eats standard 1/4 inch
cartrigdes. It listens to the name Archive Corporation, Cartridge Tape Drive
Model: 5945L-2. It's made in Singapore.

The interface board is not that generous with it's identity. The board only
reveals the text 'ARCHIVE CORP, copyright 1983'.
So I'll name a few other characteristics of this board:
next to the power connector are located 5 red LEDs, named DS1 through DS5.
The interface connector is an edge connector, with the even numbers at the top.

Some of the chips are: a Toshiba; TMP8155P
a CCN8031H
an 2764 Eprom with a sticker with the number 80182-009
a square chip saying: ARCHIVE PT; 20461-003; 609-0371939; F823564; 8701A

There is also a row with jumpers, named AA, BB, CC, DD, EE, FF, HH, KK, Y, ZZ.
Shorted are: CC, Y, ZZ.

Is there someone who can identify this tape unit for me? How can I set it's
SCSI id? Can you send me a copy of the manual of this device?

Thanks in advance, Guido Witmond.

: >Well, the put_pixel and get_pixel commands work on my falcon - and those are
: >the only ones I find useful anyway. The overhead of using v_pmarker to plot
: >points is ridiculous. Using $a001 after getting the screen parameters from
: >the vdi seems a good option. I don't know about display cards though.

: It will fail on graphics cards, will only work with 16 colors or less,
: and will likely fail under MultiTOS, and may screw up with screen acclerators
: or other enhancements, or future machines.

I'll take your word for it. I can't say I've done much in the way of
experimentation. I've been using v_pmarker lately for convenience (via Hisoft
Basic's PSET) since the VDI palette is easier to work with. I resent the
ridiculously slow speed however.

: Why are you using pixel-by-pixel screen calls anyway? At the very least,
: make a bitmap in memory, in device-independant form, and bit-blit it
: with vro_cpyfm(). And in some cases there may be an even better way.
: Never use pixel-by-pixel graphics. There has GOT to be a better way.

Probably true if I wanted to write good programs for distribution. I don't
however. My graphics interests involve writing small programs quickly which
display images which are specified pixel by pixel. I don't want to waste
space storing an image twice in memory, nor worrying about programming details.
The programs don't support MultiTos or desk accessories so screen redraws are
unneeded.
Anyway, your vro_cpyfm() option would just mean me writing pixels to a bitmap
in memory instead of the screen - then copying it. Note the extra operation.
If, as you say, I find $a001 doesn't work in 256 colour mode, I'll probably
get around to putting a PSET type routine into a library for HBasic and use
that. ($a001 is fairly slow anyway.)

Karl Wilkinson.

There have been some rumors floating around about GEnie dropping support for the Atari in the near future. I went to the head of the class, so to speak, to find out what the real story was. Here is the reply I received from Darlah Potechin, Chief Sysop of the Atari RT on GEnie:

From darlah@genie.geis.com Mon Nov 7 20:21:33 1994
>
> Although it is true that there will be a GUI for the Mac and IBM,
> that will not let the Atari market out. At the worse case
> scenario, we would have text. Though, a GUI for Atari is in the
> market to happen. Rest assured, Atari support on GEnie will
> continue.
>
> Thanks!!

So with evident pressure from the likes of AOL, it looks like GEnie is going to go graphical, too. Let's hope that whatever GUI tools they cook up for the Atari will be as good as their ST Aladdin software.

-Hutch- @ Fair Dinkum Tech

P.S.: I apologize for the crossposting but I thought this was important enough to justify it.

>Of course if YOU say so I must be hallucinating.

May be your STE is fitted with a HD Drive...???

Well I can't stop you taking POT can I, well if you wish to play
Rushian Roulette with your data, but Please don't state that its OK for
otheres to do this, I have been in the Computer game far to long to
make rash statements like you have done..

Here is good advise to any one DON'T USE HD disk on a DD Floppy drive...

NOTE: Some STE's are fitted with HD drives, there is a small plastic
verticle Pin near the front of the right side of the drive slott....

The left side has 2 pins, one for write protect sensing and the other for disk
in ....

Well I have Ghostlink here, it supposed to do that. I havn't tried
it yet, but the docs sound like its what your looking for. I got it
off a FTP site.. sorry I can't remember which one. Maybe someone
else can help there... :-)

5979. 1040 STFM slow 'warm-up'

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-09 08:59:53 UTC
From: ruokamo@ouhw11.nmp.nokia.com
Message-ID: <39q329$ira@noknic.nokia.com>
Source record: 29348

I have a basic 1 Meg Stfm. Lately (for last 1/2 year) it have started to act in following way:

Everytime when I switch it on, the diskdrive IS VERY dead- no booting, not even drive led lighting, nothing. It takes about 30 to 45 mins that the drive even 'tries' to start working. It's kind of stuck, and every now and then goes few rounds, and this continues for some time. Then suddenly it starts to work normally. Weird. That's not all. Monitor displays everything 'flashing', inverse-normal-inverse etc. The screen is quite dark, messy. But it goes to normal within few hours of use.

A guy said my St's power is faulty, which I think too.

I'm not really a 'hw-man', so even the tiniest help is wellcome. Is it cheaper to get it repaired or buy another sh st.

Thanks in advance,

Ari Ruokamo, Oulu, Finland

From: csulw@csv.warwick.ac.uk
Message-ID: <39q6mr$kh6@oregano.csv.warwick.ac.uk>
Source record: 29349

Hi,

I'd like to be able to time various calculations in a project I am working on, but the only C functions I can find are only accurate to the nearest second.

Can someone give me details about how to check an accurate clock? ie a register of a Bios function call.

Thanks,

Paul Donovan

5981. Re: gulam on F030

Newsgroup: comp.sys.atari.st.tech

From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <39qd8n$ef1@whitbeck.ncl.ac.uk>
Source record: 29350

The mupfel shell provides most of what gulam does (except the built in emacs).
It's in the gemini distribution, but can be run seperately, with or without
mint (supports mint if it's there, doesn't miss it if it's not).

Craig.

> If that means I can use the LAN port on my Falcon to Zmodem files to my
> Mac _reliably_ then this is good news.
Zmodem uses to "escape" the XON/XOFF chars, that means it should be work
with XON/XOFF handshake too. But it works fine without any handshake, if
you choose a not too high baudrate (57600 for Falcon -> MAC transfers
if the MAC is not a old & slow) (38400 MAC-> Falcon)

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Does Flash 2 support VT100\ANSI as well as the Old Flash from Antic Did?? I use Flash 1.60 because it supports VT100 Better than FZDT and it works better for me on the InterNet. Unfortunately, I also now need to use Z-Modem but Z-Modem isn't built in to Flash 1.60. Is Z-Modem built into Flash 2 like X-Modem and Y-Modem Batch was in Flash 1.60?

Also, does anyone have an inexpensive, complete copy of Flash 2 for sale?
Also, does anyone know what is the current version of Flash 2?
Also, does anyone know the Quality of Flash 2's Manual? And how big of a Manual is it and how many pages?

Please direct all replies to E-Mail:

bensmith@teleport.com

Your power supply is definitly broken!!!
I've suffered from the same problem myself. I don't know how much it's going
to cost you fixing it, but the price I paid was 750 SEK (That's about $100)!!
This was a few years ago, so the prices may have dropped a bit, and Sweden
isn't the cheapest country to buy HW in.

Greetings,

I have a need to convert a 1 bitplane image stored in a string using GFAs GET command to a 4 or 8 bitplane image on the fly. I have heard of vro_copyform(?) but I do not have the Compendium and don't know the details of this routine. If anyone could provide me with the details to use this (including GEM function number, or whatever type of routine it is) or if you could suggest an alternative, it would be greatly appreciated.

No way!

: Or, are CPX and ACC files totally incompatible ?

That's right. CPXs have a totally different structure.
For example: CPX don't have to be in RAM all the time and are loaded and
booted when you select them. And you can have more than 6 CPXs running
in one control panel.

: Cheers.
: Kev.

When I have detailed info about how to make a CPX, I'll send it to you,
when you're interested.

Craig,

-> I've designed & build a video digitiser for my Falcon, which can do
-> 25fps real time video to the screen. I'm now working on a bit of
-> image manipulation software (hopefully to do some projection work for
-> light shows at raves & stuff). I'm looking to improve my effects
-> performane by using the DSP to map the image into different shapes in
-> real time. Doing a ball & cylinder is OK using CPU, but trying to
-> then spin the cylinder (NOT around the circular axis) is just to much
-> for the CPU (rememder that I'm still playing the motion video video
-> from the camera into the mapped image).

I would really like to talk to you about some of the stuff you are
doing regarding the video manipulation. If you are interested, please
send e-mail to: cyrel@cybercube.com or cyrel@interlog.com.

Ralf.

You can do this as long as you can disable parity checking on the drives.
I used to have my Quantum 425, TECMAR 525, and Chinon 431 running off an
ADSCSI+ on my ST. I moved the Chinon 431 and TECMAR 525 to the SCSI port
of my TT.

```
Yes it is very simple to do. Your files should be named
<filename>.uaa <filename>.uab <filename>.uac etc. etc.,
all you have to do is run your uudecode program, and it will
decode all those files one by one.

> they are talking about..

When using my (now sold) STe I used to format my HD-disks to DD and I havn't had any problem with them at all, nor hav any of my freinds who have used these DD-formated HD disks. I can stil, using my Falcon, format HD-disk to DD and they work, but who wants to do that :-)

Chris.

Why would you want to do that. Horrible things those PC
keyboards satanic even - they have the caps-lock where
god intended the ctrl-key to go.

And don't forget the G++ libraries as well - there in the umich
archive but under Gnu/Tos/G++ I think. Actually I'm just
compiling the 2.6.1 libs with version 2.6.1 of the compiler.
It seems to work almost straight out of the box under MiNT with
minimal application of any of the 2.5.8 atari diffs. Except that
as originally supplied it generates MOTOROLA asm syntax instead
of the MIT syntax that GAS seems to want. Only thing to fix is
the debugging output for the new bool data type. And then mind
you I've only tested this thing on a falcon and there has been
only minimal application of the previous diffs, so I am a
little suspicious.

5998. Help: Problems with F030

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-09 18:27:09 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <39r49t$4e8@dux.dundee.ac.uk>
Source record: 29099

I have had a few strange situations with my Falcon. Sometimes the HD unit seems to stay on for ages and the machine locks. Then when I reset the machine (by using the reset button as the keys are off) it simply goes off. All the lights etc just die and it sits totally dead, I then have to reset the machine again to get it to come back on. Then all returns to normal.

This only seems to happen when I use cut/paste options in a program. The main offender is Kandinsky, which I would register if I knew it wouldn't do this every time I want to cut/paste something.

Machine: Falcon 030 with FPU, 4MB ram and 65MB IDE HD. TOS 4.01

Does anyone have any reasons or suggestions?

Rod

Probably ST and compatibles. I can't imagine them going to the
trouble of programming a graphical interface for the 8bits these days.
The Lynx and Jaguar can't even use a modem, and the portfolio is
DOS-compatible.

I've noticed a lot of software I've compiled for Unix machines saying
that it could be configured for Ataris, and I've always assumed they
meant the ST family.

> I'm trying to write a new QWK program. I've taken a few QWK packets

Cool, I've also written a new QWK program, although I'm currently
spreading it only here in Finland.

find out exactly how they are constructed. I know what each file does,
>eg. the .MES and .NDX files, but there are a few bytes I just cannot figure
>out.

I have documentation for that, i'll put it here so you, and perhaps
others too, can use it. This is quite complete documentation of the QWK
format. Lengthy, about 50 kilos to come...

QWK Mail Packet File Layout
by Patrick Y. Lee

Version 1.6 - December 19, 1992
Added off-line commands for QSO (door for TBBS), thanks to
message from Bob Hartman in the FidoNet Off-line echo. All
8-bit characters have been replaced with either blanks or
equivalent 7-bit characters so I can send this file easily via
Internet email. Line 9 of the CONTROL.DAT file seems to be
used by a few doors to indicate the NetMail conference.
Version 1.5 - July 30, 1992
Added off-line commands for Cam-Mail door. Fixed error in the
status flag section. The descriptions for `*' and `+' are
incorrect. Thanks to Bob Blaylock for bringing this up.
Version 1.4 - July 18, 1992
Fixed a few minor mistakes in the documentation (thanks to
Cody Gibson). Nothing really major. Also completed the
Netmail section of the documentation.
Version 1.3 - July 6, 1992
Added changes to the QWK format adopted by Qmail door. Spe-
cifically line 10 of CONTROL.DAT file and bytes 126-127 of
MESSAGES.DAT file. Please refer to the appropriate section
for the changes.
Version 1.2 - May 31, 1992
Added a few items to the DOOR.ID file that is being supported
by Qmail DeLuxe2 version 1.25.
Version 1.1 - March 15, 1992
Minor fixes here and there to make everything just right.
Version 1.0 - February 23, 1992
First release.

[1] Introduction

[1.1] Intent

This document is written to facilitate programmers who want to write QWK-format mail doors or readers. It is intended to be a comprehensive reference covering all areas of QWK-format mail processing. Detailed break down of each file is included, as are implementation information. In addition, door and reader specific information may be included, when such information are available to me.

[1.2] History

The QWK-format was invented by Mark "Sparky" Herring in 1987. It was based on Clark Development Corporation's PCBoard version 12.0 message base format. Off-line mail reading has become popular only in recent years. Prior to summer of 1990, there were only two QWK-format off-line mail reader programs. They were Qmail DeLuxe by Mark Herring and EZ-Reader by Eric Cockrell. Similarly for the doors, there were only two -- Qmail by Mark Herring and MarkMail by Mark Turner. They were both for PCBoard systems.

A lot has changed in both off-line reader and mail door markets since summer 1990. Now, there are more than a dozen off-line mail readers

for the PC. Readers for the Macintosh, Amiga, and Atari exist as well. There are over a half dozen doors for PCBoard, and QWK-format doors exist for virtually all of the popular BBS softwares. All of these happened in less than two years! More readers and doors are in development as I write this, keep up the excellent work. In addition to doors, some BBS softwares has QWK-format mail facility built in.

Off-line mail reading is an integral part of BBS calling. Conference traffic and selection on all networks have grown dramatically in recent years that on-line reading is a thing of the past. Off-line mail reading offers an alternative to reading mail on-line -- It offers speed that cannot be achieved with on-line mail reading.

The reason why QWK-format readers and doors seem to have gained popularity is probably dued to its openness. The format is readily available to any programmer who wishes to write a program that utilize it. Proprietary is a thing of the past, it does not work! Openness is here to stay and QWK-format is a part of it.

[1.3] Questions, corrections, etc.

Most of the message networks today have a conference/echo devoted to discussion of off-line readers and mail doors. The ones I know are on FidoNet, ILink, Intelec, and RIME. If you have questions after reading anything in here, feel free to drop by any of the above conference /echo and I am sure other QWK authors will try to help.

I can be reached at:

CompuServe: >INTERNET:patlee@panix.com
FidoNet: Off-line echo
ILink: Off-line conference
Intelec: Off-line conference
Internet: patlee@panix.com
PlanoNet: Reviews conference
RIME: ->RUNNINGB, Off-line, Common, Net Admin., Shareware, New Users, and Session Manager conferences

Any corrections, extensions, comments, and criticisms are welcomed. Messages from Internet and RIME will probably be answered first. But I do check mail on all other places at least once a week.

[2] Conventions & overview

All offsets referenced in this document will be relative to 1. I am not a computer, I start counting at one, not zero!

Words which are enclosed in quotes should be entered as-is. The quotations are not part of the string unless noted.

You may have noticed I use the phrase "mail program" or "mail facility" instead of mail doors. This is because some BBS softwares offer the option of creating QWK-format mail packets right from the BBS. With those, there is no need for an external mail door.

[2.1] The BBS ID

The BBS ID (denoted as BBSID) is a 1-8 characters word that identifies a particular BBS. This identifier should be obtained from line 5 of the CONTROL.DAT file (see section 3.2.1).

[2.2] Packet compression

Most mail packets are compressed when created by the mail door in order to save download time and disk space. However, many off-line reader programs allow the user to unarchive a mail packet outside of the reader program, so the reader will not have to unarchive it. Upon exit, the reader will not call the archiver to save it. It is up to the user to archive the replies. This is useful if the user has limited memory and cannot shell out to DOS to run the unarchive program. For readers based on non-PC equipment, the user may be using less common compression program that does not have command line equivalent.

[2.3] Packet transfer & protocols

There is no set rule on what transfer protocol should be used. However, it would be nice for the mail program on the BBS to provide the Sysop with options as to what to offer. This should be a configuration option for the user.

[2.4] Specifications & limitations

There aren't many known limits in the QWK specification. However, various networks seem to impose artificial limits. On many of the PC-based networks, 99-lines appears to be the upper limit for some softwares. However, most of the readers can handle more than that. Reader authors reading this may want to offer the option to split replies into n lines each (the actual length should be user definable so when the network software permits, the user can increase this number).

[3] QWK files

[3.1] Naming convention

Generally, the name of the mail packet is BBSID.QWK. However, this does not have to be the case. When the user downloads more than one mail packet at one time, either the mail program or the transfer protocol program will rename the second and subsequent mail packets to other names. They will either change the file extension or add a number to the end of the filename. In either case, you should not rely on the name of the QWK file as the BBSID. The BBSID, as mentioned before, should be obtained from line 5 of the CONTROL.DAT file. In addition, mail packets do not have to end with QWK extension either. The user may choose to name them with other file extensions.

[3.2] Control file (CONTROL.DAT)

The CONTROL.DAT file is a simple ASCII file. Each line is terminated with a carriage return and line feed combination. All lines should

start on the first column.

```
Line #
1 My BBS BBS name
2 New York, NY BBS city and state
3 212-555-1212 BBS phone number
4 John Doe, Sysop BBS Sysop name
5 20052,MYBBS Mail door registration #, BBSID
6 01-01-1991,23:59:59 Mail packet creation time
7 JANE DOE User name (upper case)
8 Name of menu for Qmail, blank if none
9 0 ? Seem to be always zero. A few doors,
such as DCQWK for TAG is using this
field to indicate the conference where
Fido NetMail should be placed. This
gives the reader program the ability
easily send NetMail.
10 999 Total number of messages in packet

Some mail doors will offer the option of sending an abbreviated conference list. That means the list will contain only conferences the user has selected. This is done because some mail readers cannot handle more than n conferences at this time. Users using those readers will need this option if the BBS they call have too many conferences.

[3.3] Welcome file

This file usually contains the log on screen from the BBS. The exact filename is specified in the CONTROL.DAT file, after the conference list. This file may be in any format the Sysop chooses it be -- usually either in plain ASCII or with ANSI screen control code. Some Sysops (notably PCBoard Sysops) may use BBS-specific color change code in this file as well. Current mail programs seem to handle the translations between BBS-specific code to ANSI based screen control codes.

Even if the CONTROL.DAT file contains the filename of this file, it may not actually exist in the mail packet. Sometimes, users will manually delete this file before entering the mail reader. Some offline readers offer the option to not display this welcome screen; some will display this file regardless. Some doors, similarly, will offer option to the user to not send this file.

[3.4] Goodbye file

Similar to the welcome file above, the filename to the goodbye file is in the CONTROL.DAT file. This is the file the BBS displays when the user logs off the board. It is optional, as always, to send this file or to display it.

[3.5] News file

Many mail doors offer the option to send the news file from the BBS. Most will only send this when it has been updated. Like the welcome and goodbye files, the filename to the news file is found in the CONTROL.DAT file. It can be in any format the Sysop chooses, but usually in either ASCII or ANSI. Like the welcome screen, current mail facilities seem to handle translation between BBS-specific control codes to ANSI screen control codes.

[3.6] Qmail DeLuxe2 menu file

This file is of use only for Qmail DeLuxe2 mail reader by Sparkware.
The filename is found on line 8 of the CONTROL.DAT file.

[3.7] New uploads listing (NEWFILES.DAT)

Most mail programs on the BBS will offer the option to scan new files uploaded to the BBS. The result is found in a file named NEWFILES.DAT. The mail program, if implementing this, should update the last file scan field in the user's profile, if there is such a field, as well as other information required by the BBS. The mail program should, of course, scan new files only in those areas the user is allowed access.

[3.8] Bulletin files (BLT-x.y)

Most mail programs will also offer the option to include updated bulletin files found on the BBS in the mail packet. The bulletins are named BLT-x.y, where x is the conference/echo the bulletin came from, and y the bulletin's actual number. The mail program will have to take care of updating the last read date on the bulletins in the user record.

[3.9] Message file (MESSAGES.DAT)

The MESSAGES.DAT file is the most important. This is where all of the messages are contained in. The QWK file format is based on PCBoard 12.0 message base format from Clark Development Corporation (maker of PCBoard BBS software).

The file has a logical record length of 128-bytes. The first record of MESSAGES.DAT always contain a copyright notice saying "Produced by Qmail...Copyright (c) 1987 by Sparkware. All Rights Reserved". The rest of the record is space filled. Actual messages consist of a 128-bytes header, plus one or more 128-bytes block with the message text. Actual messages start in record 2. The header block is layed out as follows:

Offset Length Description
------ ------ --
1 1 Message status flag (unsigned character)
' ' = public, unread
'-' = public, read
'*' = private, read by someone but not by intended
recipient
'+' = private, read by official recipient
'~' = comment to Sysop, unread
'`' = comment to Sysop, read
'%' = sender password protected, unread
'^' = sender password protected, read
'!' = group password protected, unread
'#' = group password protected, read
'$' = group password protected to all
2 7 Message number (in ASCII)
9 8 Date (mm-dd-yy, in ASCII)

17 5 Time (24 hour hh:mm, in ASCII)
22 25 To (uppercase, left justified)
47 25 From (uppercase, left justified)
72 25 Subject of message (mixed case)
97 12 Password (space filled)
109 8 Reference message number (in ASCII)
117 6 Number of 128-bytes blocks in message (including the
header, in ASCII; the lowest value should be 2, header
plus one block message; this number may not be left
flushed within the field)
123 1 Flag (ASCII 225 means message is active; ASCII 226
means this message is to be killed)
124 2 Conference number (unsigned word)
126 2 Logical message number in the current packet; i.e.
this number will be 1 for the first message, 2 for the
second, and so on. (unsigned word)
128 1 Indicates whether the message has a network tag-line
or not. A value of '*' indicates that a network tag-
line is present; a value of ' ' (space) indicates
there isn't one. Messages sent to readers (non-net-
status) generally leave this as a space. Only network
softwares need this information.

Fields such as To, From, Subject, Message #, Reference #, and the like are space padded if they are shorter than the field's length.

The message text starts in the next record. You can find out how many blocks make up one message by looking at the value of "Number of 128 byte blocks". Instead of carriage return and line feed combination, each line in the message end with an ASCII 227 (pi character) symbol. There are reports that some (buggy) readers have problems with messag-es which do not end the last line in the message with an ASCII 227. If a message does not completely occupy the 128-bytes block, the re-mainder of the block is padded with space or null.

Note that there seems to exist old doors which will use one byte to represent the conference number and pad the other one with an ASCII 32 character. The program reading this information will have to deter-mine whether the ASCII 32 in byte 125 of the header is a filler or part of the unsigned word. One method is to look in the CONTROL.DAT file to determine the highest conference number.

Even though most mail programs will generate MESSAGES.DAT files that appear in conference order, this is not always the case. Tomcat! (mail door for Wildcat! BBS) generates MESSAGES.DAT that is not in conference order. This is due to how Wildcat! itself stores mail on the BBS. Another known system that behaves this way is Auntie, which has its mail door QWiKer.

Note that some mail doors offer the option of sending a mail packet even though there may be no messages to send -- thus an empty MESSAG-ES.DAT file. This was tested with Qmail 4.0 door and it sent a MES-

SAGES.DAT file that contains a few empty 128-bytes blocks. Other mail doors seem to be able to produce QWK files without the MESSAGES.DAT file at all! Apparently, there was no standard established in this procedure.

[3.10] Index files (*.NDX)

[3.10.1] Conference indices

The index files contain a list of pointers pointing to the beginning of messages in the MESSAGES.DAT file. The pointer is in terms of the 128-bytes block logical record that the MESSAGES.DAT file is in. Each conference has its own xxx.NDX file, where xxx is the conference number left padded with zeroes. Some mail programs offer the user the option to not generate index files. So the mail readers need to create the index files if they are missing.

EZ-Reader 1.xx versions will convert the NDX files from Microsoft MKS format into IEEE long integer format. The bad part about this is that the user may store those index files back into the QWK file. When another reader reads the index files, it will be very confused!

Special note for BBSes with more than 999 conferences: Index files for conferences with four digit conference numbers is named xxxx.NDX, where xxxx is the conference number (left padded with zeroes). The filenames for three digit conferences are still named xxx.NDX on these boards. I would assume filenames for conferences in the five digit range is xxxxx.NDX, but I have not seen a BBS with 10,000 or more conferences yet!

Each NDX file uses a five bytes logical record length and is formatted to:

Offset Length Description
------ ------ ---
1 4 Record number pointing to corresponding message in
MESSAGES.DAT. This number is in the Microsoft MKS$
BASIC format.
5 1 Conference number of the message. This byte should
not be used because it duplicates both the filename of
the index file and the conference # in the header. It
is also one byte long, which is insufficient to handle
conferences over 255.

Please refer to appendix B for routines to deal with MKS numbers.

[3.10.2] Personal index (PERSONAL.NDX)

There is a special index file named PERSONAL.NDX. This file contains pointers to messages which are addressed to the user, i.e. personal messages. Some mail door and utility programs also allow the selection of other messages to be flagged as personal messages.

[3.11] Pointer file

Pointer file is generally included so that the user can reset the last read pointers on the mail program, in case there is a crash on the BBS or some other mishaps. There should be little reason for the reader program to access the pointer file.

The pointer files I have seen are:

KMail BBSID.PNT
MarkMail BBSID.PNT
Qmail BBSID.PTR
QWiKer HMP.PTR
SFMailQwk BBSID.SFP

Additions to this list are welcomed.

[3.12] SESSION.TXT

This file, if included, will contain the message scanning screen the user sees from the door.

[4] REP files

[4.1] Naming convention

The reply file is named BBSID.MSG, where BBSID is the ID code for the BBS found on line 5 of the CONTROL.DAT file. Once this file has been created, the mail reader can archive it up into a file with REP extension.

[4.2] Message file (BBSID.MSG)

Replies use the same format as the MESSAGES.DAT file, except that message number field will contain the conference number instead. In other words, the conference number will be placed in the two bytes (binary) starting at offset 124, as well as the message number field (ASCII) at offset 2.

A private message is indicated by '*' in the message status flag. For some reason, most mail doors only accept '*' as a private message and not '+'.

The first 128-bytes record of the file is the header. Instead of the copyright notice, it contains the BBSID of the BBS. This 1-8 character BBSID must start at the very first byte and must match what the BBS has. The rest of the record is space padded. The replies start at record 2. Each reply message will have a 128-bytes header, plus one or more for the message text; followed by another header, and so on.

The mail program must check to make sure the BBSID in the first block of the BBSID.MSG file matches what the BBS has!

[4.3] Door control messages

These messages allow the user to change their setup on the BBS by simply entering a message. The goal is to allow the user to be able

to control most areas of the BBS via the mail door. Different mail doors have different capabilities. Most all of them offer the ability to add and drop a conference, as well as reset the last read pointers in a conference.

There are two trends being developed for door control messages. The one being referred to as the "old" style accepts one command per message (command entered in the subject line); whereas the "new" style accepts multiple commands per message (commands entered in the message body). The old style is by far the more popular but more and more doors are beginning to offer both.

[4.3.1] DOOR.ID file

The DOOR.ID file was first introduced by Greg Hewgill with Tomcat! mail door and SLMR mail reader. Since then, many other authors have picked up this idea and use the format. This file provides the necessary identifiers a reader needs to send add, drop, etc. messages to the mail door. It tells the reader who to address the message to and what can be put in the subject line.

DOOR = <doorname> This is the name of the door that created the QWK packet, i.e. <doorname> = Tomcat.
VERSION = <doorversion> This is the version number of the door that created the packet, i.e. <doorversion> = 2.9.
SYSTEM = <systemtype> This is the underlying BBS system type and version, i.e. <systemtype> = Wildcat 2.55.
CONTROLNAME = <controlname> This is the name to which the reader should send control messages, eg. <controlname> = TOMCAT.
CONTROLTYPE = <controltype> This can be one of ADD, DROP, REQUEST, or others. ADD and DROP are pretty obvious (they work as in MarkMail), and REQUEST is for use with BBS systems that support file attachments. Try out SLMR with CONTROLTYPE = REQUEST and use the Q function. (This seems to be a Wildcat! BBS feature.)
RECEIPT This flag indicates that the door/BBS is capable of return receipts when a message is received. If the first three letters of the subject are RRR, then the door should strip the RRR and set the 'return-receipt-requested' flag on the corresponding message. When the addressee reads this message, the BBS generates a message with the date/time it was read.

MIXEDCASE = YES If this line is found then the reader
will let you use upper and lower case
names and subjects. This is first found
in Qmail DeLuxe2 1.25 version. Most
other QWK readers permit the use of
mixed case subject lines but force the
names to upper case only.
FIDOTAG = YES If this line is found then the reader
will automatically use FidoNet compliant
tag-lines.

None of the lines are actually required and they may appear in any
order. Of course, you would need a CONTROLNAME if you have any
CONTROLTYPE lines.

[4.3.2] Qmail

Qmail uses the "new" style of control message; therefore, send a mes-
sage addressed to "QMAIL" with a subject of "CONFIG". Then, enter any
of the commands listed below inside the text of your message. Remem-
ber to use one command per line.

ADD <confnum> Add a conference into the Qmail Door scanning
list. "YOURS" can also be added to the com-
mand if the user wishes to receive messages
only addressed them. i.e. "ADD 1 YOURS".
"YOURS ALL" can be added to select a confer-
ence for all mailed addressed to the user and
to "ALL".
DROP <confnum> Drop a conference from the Qmail Door scan-
ning list.
RESET <confnum> <value> Resets a conference to a particular value.
The user can use "HIGH-xxx" to set the con-
ference to the highest message in the base.
CITY <value> Changes the "city" field in the user's
PCBoard entry.
PASSWORD <value> Changes the user's login password.
BPHONE <value> Business/data phone number
HPHONE <value> Home/voice phone number
PCBEXPERT <on|off> Turns the PCBoard expert mode ON or OFF.
PCBPROT <value> PCBoard file transfer protocol (A-Z).
PAGELEN <value> Set page length inside PCBoard.
PCBCOMMENT <value> Set user maintained comment.
AUTOSTART <value> Qmail Door autostart command.
PROTOCOL <value> Qmail Door file transfer protocol (A-Z).
EXPERT <ON or OFF> Turns the Qmail Door expert mode ON or OFF.
MAXSIZE <value> Maximum size of the user's .QWK packet (in
bytes)
MAXNUMBER <value> Maximum number of messages per conference.

[4.3.3] MarkMail

Send a message addressed to "MARKMAIL" with the subject line saying:

ADD [value] in the conference you want to add
DROP in the conference you want to drop
YOUR [value] in the conference you want only your mail sent
YA [value] in the conference you want only your mail + mail
addressed to "ALL"
FILES ON or OFF in any conference to tell MarkMail whether to scan
for new files or not.
BLTS ON or OFF to turn on and off, respectively, of receiving
bulletins.
OWN ON or OFF to turn on and off, respectively, of receiving
messages you sent
DELUXE ON or OFF to turn on and off, respectively, of receiving
DeLuxe menu
LIMIT <size> to set the maximum size of MESSAGES.DAT file can
be, it cannot exceed what the Sysop has set up

An optional number can be added onto the commands "ADD", "YOUR", and "YA". If this number is positive, then it will be treated as an absolute message number. MarkMail will set your last read pointer to that number. If it is negative, MarkMail will set your last read pointer to the highest minus that number. For example: "ADD -50" will add the conference and set the last read pointer to the highest in the conference minus 50.

[4.3.4] KMail

Send a private message addressed to "KMAIL" in the conference that you want to add, drop, or reset. The commands are "ADD", "DROP", and "RESET #", respectively. The "#" is the message number you want your last read pointer in the conference be set to.

[4.3.5] RoseMail

The RoseMail door allows configuration information be placed in either the subject line or message text. The message must be addressed to "ROSEMAIL". For only one command, it can be placed in the subject line. For more than one changes, the subject line must say "CONFIG" and each change be placed in the message text. Every line should be left justified. Valid commands are:

Command	Example
ADD <Conference> [<Message #>] [<Yours>]	ADD 2 -3 Y
DROP <Conference>	DROP 2
RESET <Conference> <Message #>	RESET 12 5000
PCBEXPERT <ON | OFF> - PCBoard expert mode	PCBEXPERT ON
EXPERT <ON | OFF> - RoseMail expert mode	EXPERT OFF
PCBPROT <A - Z> - PCBoard protocol	PCBPROT Z
PROT <A - Z> - RoseMail protocol	PROT G
PAGELEN <Number> - Page length	PAGELEN 20
MAXSIZE <Kbytes> - Max packet size in Kb	MAXSIZE 100

MAXNUMBER <max msgs/conference> MAXNUMBER 100
JUMPSTART <Sequence or OFF> JUMPSTART D;Y;Q
MAXPACKET <max msgs/packet> MAXPACKET 500
AUTOSTART <Sequence or OFF> - same as jumpstart AUTOSTART OFF
OPT <##> <ON | OFF> - set door option OPT 2 OFF

[4.3.6] Complete Mail Door

Send message to "CMPMAIL", the commands are "ADD" and "DROP". This message must be sent in the conference that you want to add or drop.

[4.3.7] The MainMail System

Send a message addressed to "MAINMAIL" with the subject line saying:

ADD [value] in the conference you want to add
DROP in the conference you want to drop
YOURS [value] in the conference you want only your mail sent
YOURS ALL [value] in the conference you want only your mail + mail addressed to "ALL"

The optional [value] parameter functions identically to the MarkMail door -- positive number indicates an absolute message number, negative number will set your last read pointer that many messages from the last message.

[4.3.8] BGQWK

The BGQWK mail door for GT Power supports file request via message. To request a file, simply enter a message:

To: BGQWK
Subject: DL:FILENAME.EXT

The FILENAME.EXT has to be exact name, wildcard is not supported. The message text can be left blank.

The only limit on the file request feature is your time and/or your file ratio. The transfer of the requested file(s) will start right after the QWK download is completed. The only exception is when the user is using a bidirectional transfer protocol. There, the REP and QWK are sent at the same time, hence, the file request cannot be processed until the QWK transfer is completed.

[4.3.9] UltraBBS

Send a private message addressed to "ULTRABBS" in the conference that you want to add, drop, or reset. The commands are "ADD", "DROP", and "RESET #", respectively. The "#" is the message number you want your last read pointer in the conference be set to. The QWK mail door for UltraBBS is built in and it generates the DOOR.ID file as well.

[4.3.10] TriMail

TriMail is the QWK door for TriBBS. This door will accept off-line configuration options sent to Qmail, MarkMail, or TriMail. This means you can send the message to: "QMAIL", "MARKMAIL", or "TRIMAIL" in the appropriate conference and it will work. The available options are:

BLTS ON Turn bulletin scan on
BLTS OFF Turn bulletin scan off
FILES ON Turn new files scan on
FILES OFF Turn new files scan off
RESET <value> Reset last message read pointer
DROP Drop this conference
ADD [value] Add this conference. The [value] is optional and will set the last message read pointer.

[4.3.11] Cam-Mail

Address your message to either QMAIL or CAM-MAIL. Then enter the command in the subject line. Valid commands are:

Add Add conferences for scanning
Bulletins On Download all new bulletins in QWK packet
Bulletins Off Turn off download of new bulletins
Color On Download the QWK packet in color, if available
Color Off Turn off download in color
Drop Drop a conference from scanning
Duplicates On Turn on duplicate checking in REP files
Duplicates Off Turn off duplicate checking
Files On Download new files list in QWK packet
Files Off Turn off download of new files list
Goodbye On Send the Goodbye files with the QWK packet
Goodbye Off Does not send the Goodbye files
Mailflags On Notifies users they have mail
Mailflags Off Does not notify users of mail
NDX On Create NDX files for QWK packet
NDX Off Does not create NDX files
Welcome On Send the Welcome file with the QWK packet
Welcome Off Does not send the Welcome file

[4.3.12] QSO

QSO supports both "old" and "new" style off-line configuration commands. For the "old" style, message should be addressed to either QMAIL or QSO. The message must be entered in the conference it affects, with the subject line containing:

ADD Add conference
ADD -20 Add conference and set last read pointer to the highest number in conference minus 20
ADD HIGH-20 Same as above
ADD LOW+50 Add conference and set last read pointer to the lowest number in conference plus 50
ADD 1234 Add conference and set last read pointer to a specific message number

ADD YOURS Add conference for messages addressed to you only;
the YOURS keyword may appear before or after the
message number; YOURS may be abbreviated as just Y
DROP Drop the conference
RESET Reset last read pointer to highest in conference
RESET -20 Reset to highest number minus 20
RESET HIGH-20 Same as above
RESET LOW+50 Reset to lowest number plus 50
RESET 1234 Reset last read pointer to specific number

For the "new" style message, enter the message addressed to either
"QMAIL" or "QSO" with the subject line saying "CONFIG". The message
text should have commands similar to the ones listed above. The only
exception is that the conference number must be entered immediately
after the first keyword. For example:

ADD 15 -20 Add conference 15, reset pointer to high minus 20
DROP 137 Drop conference 137
ADD 20 HIGH-50 Y Add conference 20 for mail addressed to user only,
and set the pointer to highest minus 50

QSO supports file sending in the mail packet as well. Attached files
have the name EMnnnnn, where nnnnn is a five digit leading zero padded
number indicating the message number in which the request was sent.
The plain text file ATTACHED.LST lists the real name of the file, and
has the following format (one line per record):

<conference #>, <message #>, <EMnnnnn filename>, <real name>

<conference #> Conference where the request came from
<message #> Message number where request came from
<EMnnnnn filename> File as named inside the QWK file
<real name> Original filename as seen on the BBS

For messages that has an enclosed file, the last line of the message
has the line:

*Enclosed file: filename.ext

The reader program must send a request to obtain this file. The re-
quest is in the format similar to any other control messages:

To: QSO
Subject: REQUEST nnnnn

where nnnnn is the message number that contains this attached file.
This message must be sent in the conference where that contains that
message. Alternatively, the "new" style can also be used. With the
line "REQUEST confnum nnnnn" in the message text.

To upload a file that is attached to a message, the file ATTXREF.DAT
must be created. The file is a plain text file with one line corre-
sponding to each message in the reply file. Blank lines must be in-
cluded for those messages that do not have files attached to them. A

non-blank line has the following format to indicate a file is attached to that message:

<internal name>, <real name>

<internal name> is any non-conflicting filename
<real name> the name as it should appear on the BBS

[4.4] Turning off the echo flag

In order to send a non-echoed message (not send out to other BBSs), a user can enter "NE:" in front of the subject line. This feature may not be offered in all mail doors.

Some mail doors strip out the "NE:" from the subject line. However, that leaves the recipient with nothing to tell that the message was not echoed. Therefore, it is better if "NE:" is not stripped.

[4.5] Tag-lines

The most common format for a reader tag-line is:

---
* My reader v1.00 * The rest of the tag-line.

(The asterisks above should be replaced by IBM extended character number 254 - a square block.)

The three dashes is called a tear-line. The tag-line is appended to the end of the message and is usually one line only. It is preferred that tag-lines conform to this format so that networking softwares such as QNet and RNet will not add another tearline to the message when they process it.

Softwares on FidoNet does not like mail readers adding a tear-line of their own, so if your mail reader offers a FidoNet mode, you will need to get rid of the tear-line. Another item which differs between the FidoNet and PC-based networks is that FidoNet does not like extended ASCII characters. So your reader may want to strip high ASCII if the user has FidoNet mode on. Acceptable tag-line style, I believe, is just this:

* My Reader v1.00 * The rest of the tag-line.

[5] Net mail

QWK mail doors can be used along or in conjunction with QWK network softwares to operate a network. Many such network exists. A Net-Status packet (one that can be imported to BBS message base) is very similar to a normal mail packet users get. The only difference is at the end of the MESSAGES.DAT file. There, a series of 128 byte blocks are appended to indicate Net-Status.

One byte represent one conference, in groups of 128. A non-zero value means the user is allowed Net Mail status for that conference. The

number of Net Status blocks appended to the MESSAGES.DAT file only needs to cover the highest conference the user has access to.

The reason these packets have to be different? Using QWK mail doors to send and receive messages require you to be able to send messages in other user's name as well as receive private messages in conferences. The Net-Status tells the mail door to import the messages even if they are from another name.

The only weird implementation here is that the block with the highest conference numbers come before the lower ones. Hence, to illustrate:

```
Conference 128
| Conference 129

0090 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00 conferences
00A0 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00 0-127
00B0 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00
00C0 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00
00D0 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00
00E0 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 00
00F0 00 00 00 00 00 00 00 00-00 00 00 00 00 00 00 FF
```

This example shows that this user has Net Status in conferences 1, 127, 130, and 254.

MarkMail and KMail doors (both for PCBoard) choos to implement things a little differently. Instead of appending Net-Status blocks to the end of the MESSAGES.DAT file, they simply put "MarkMail" or "Kmail..." in the first 8 position of the file and the user is granted Net-Status in all conferences.

[A] Credits and Contributions

Mark "Sparky" Herring, who originated the QWK-format.

Tim Farley, who started this documentation back in the summer of 1990. The general outline here is the work of Tim. I filled in the blanks.

Jeffery Foy, who gave us the format for Microsoft single binary versus IEEE format.

Greg Hewgill, who (if I remember correctly) wrote the Turbo Pascal routines (included in here) to convert between MKS and TP LongInt.

Dennis McCunney, who is the host of the Off-line conference on RIME, is very knowledgeable in off-line reading concept and programs. His goal is to have one reader that can read mail packet from any source.

Cody Gibson and Jeffery Foy, whose information on Net-Status packet are included here.

All those who have been around the Off-line conferences on ILink (the oldest of the four I participate), RIME, Fido, and Intelec, who have provided great help over the past three years. The bulk of the information presented here are from messages in those conferences. These people include, but are no limited to, the followings: Dane Beko, Joseph Carnage, Marcos Della, Joey Lizzi, Mark May, and Jim Smith.

[B] Sample Turbo Pascal and C code

Here are a few routines in Turbo Pascal and C to convert Microsoft BASIC MKS format to usable IEEE long integer. These are collected over the networks and there is no guarantee that they will work for you!

Turbo Pascal (Greg Hewgill ?):

```
type
bsingle = array [0..3] of byte;

{ converts TP real to Microsoft 4 bytes single }

procedure real_to_msb (preal : real; var b : bsingle);
var
r : array [0 .. 5] of byte absolute preal;
begin
b [3] := r [0];
move (r [3], b [0], 3);
end; { procedure real_to_msb }

{ converts Microsoft 4 bytes single to TP real }

function msb_to_real (b : bsingle) : real;
var
preal : real;
r : array [0..5] of byte absolute preal;
begin
r [0] := b [3];
r [1] := 0;
r [2] := 0;
```

```
move (b [0], r [3], 3);
msb_to_real := preal;
end; { function msb_to_real }
```

Another Turbo Pascal routine to convert Microsoft single to TP LongInt (Marcos Della):

```
index := ((mssingle and not $ff000000) or $00800000) shr (24 -
((mssingle shr 24) and $7f)) - 1;
```

C (identify yourself if you wrote this routine):

```
/* converts 4 bytes Microsoft MKS format to long integer */

unsigned long mbf_to_int (m1, m2, m3, exp)
unsigned int m1, m2, m3, exp;
{
return (((m1 + ((unsigned long) m2 << 8) + ((unsigned long) m3 <<
16)) | 0x800000L) >> (24 - (exp - 0x80)));
}
```

Microsoft binary (by Jeffery Foy):

```
31 - 24 23 22 - 0 <-- bit position
+-----------------+----------+
| exponent | sign | mantissa |
+----------+------+----------+
```

IEEE (C/Pascal/etc.):

```
31 30 - 23 22 - 0 <-- bit position
+---------------------------+
| sign | exponent | mantissa |
+------+----------+----------+
```

In both cases, the sign is one bit, the exponent is 8 bits, and the mantissa is 23 bits. You can write your own, optimized, routine to convert between the two formats using the above bit layout.

[C] Sample message

Here is a sample message in hex and ASCII format:

```

6004. How to turn off automatic HDD shutoff..???

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-09 21:13:28 UTC
From: THIETAVUO@FINABO.ABO.FI
Message-ID: <39re1o$6da@josie.abo.fi>
Source record: 29202

I have a curious problem... I recently changed my 84 Mb 2.5" Conner drive for my Falcon to a bigger 3.5" one. I chose a 420 Mb, 14 mS Seagate ST3491A drive, got it finally crunched inside the original covers (yes, it can be done when you leave one part of the metallic shield out..), and everything seemed to be ok. HDX 5 recognized this drive without problems, and got it formatted. Then I made my first mistake; I tried to partition it with SCSITOOLS Junior software instead of (the less user-friendly) HDX. The result: BOMBS whenever I switched on the computer with HDD connected to cables!! THIS was pretty serious, since there was no way to boot the computer when the hard drive was electrically connected to it. I guess, something had been screwed up in the boot sector, or something like that...

Well, finally - with tricks very unrecommended - I got the thing formatted again, and I threw my SCSITOOLS as far away from the drive as I could!

Now I partitioned the drive with HDDRIVER software. Perfecto. The drive works like a dream; it's damned fast (over 1900 kb/s with Falcon!) - BUT......+

After about 30 seconds unused, the drive says "CLICK" - and shuts itself off.. Yes; when you don't use the HDD in 30 secs, that devil thinks it isn't needed - and goes to sleep... Of course, it wakes up - rather quickly - when somebody calls it. BUT guess what this sleepiness causes when one uses virtual memory? Guess, what 68030's PMMU, TOS and especially OUTSIDE 3.2 virtual memory manager think of "sleeping memory"..? =-(Right: weird things occur. And the Falcon locks very often totally up.

Can anyone tell me, what the heck is going on inside my Seagate/Falcon - and if there's anything that can be done?

Thank you VERY many for any help; this is pretty awful..!

8-)

Greetings, Tommi

>X-Modem and Y-Modem Batch was in Flash 1.60?

You will find that FLASH 2 is a bit to slow, they have made it 100% GEM compatible, so you will need a screen accelerator to get back to a normal speed...

Flash 1.6, well I use GSZRZ Zmodem all the time, its on many sites....

NOTE: Alan Page did not have any thing good to say about FLASH 2, his comments was that it still had some of the flaws that Flash 1.6 has...

I doubt that it uses the DSP, but I could be wrong. I believe there is a
demo of this program on atari.archive.umich.edu, so that might answer many
of your questions.

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94
==========

NEW EXHIBITORS JUST ANNOUNCED: GRIBNIF AND ANODYNE SOFTWARE!

Toad Computers is proud to announce HOLIDAY FESTIVAL '94 which will take place on December 3rd & 4th, 1994. Last year's event drew 500 people from all over the country and featured guests and exhibitors such as:

- Dave Small
- Joe Waters, Ed. of Current Notes
- Charles Smeton (STraight FAX!)
- Dave Troy (CN Columnist / Toad Co-owner)
- Tim Reyes
- MajicSoft
- Carter's Creative Computer
- Greg Ondo of Steinberg Jones

We'll feature free hot apple cider, door prizes and more! We'll also have another raffle to benefit Habitat for Humanity (which raised over $500 last year!!)

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping Center in Severna Park, Maryland. There's unlimited free parking and lots to see and do nearby, as we're nestled between Washington, Baltimore, and Annapolis.

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Bob Luneski, Oregon Research
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including Dave and Jennifer Troy

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm

Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146-2925

Voice: (410) 544-6943
Orders: (800) 448-8623
FAX: (410) 544-1329
BBS: (410) 544-6999
TOADFAX: (410) 544-0098

For MAPS, DIRECTIONS, HOTEL ACCOMODATIONS, or any other
information you may need, please call us!

The local HOLIDAY INN is offering $59 (reg $90) rooms for the
show. For more information, please call us at (410) 544-6943!

Keep an eye open for further developments on the show! We plan to have
announcements on and in:

- GEnie - CompuServe
- Internet - Delphi
- Current Notes - ST Informer

We will also be mailing postcards in support of the show
sometime in November. If you know of someone who would like
to come to the show, give us their name and address and
we'll be sure they get the information!

ADMISSION IS FREE!!!! ADMISSION IS FREE!!!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

David Troy
Jennifer Troy
Ray Mitchell

Well, it does sound like it has to do with power. One easy thing to do
(that has a surprisingly high success rate) is to remove the power supply
(it is all one piece, comes out with just two or three screws) and use a
soldering iron to remelt all the solder points on the unit. If you have a
"cold" or cracked solder joint, this should fix it, and it is quite easy to
do as you are not actually adding any solder or anything. Also, I think
there is a fuse on there that you can check or just replace (they are cheap).
Inspect it visually, looking for loose wires, signs of heat, charcoal <grin>.

Also, "exercise" the connector that hooks the power supply to the motherboard.
Just plug and unplug it several times, in case any tiny layer of corrosion
has formed. Do the same with the external power cord. In fact, try a new
external power cord, and an outlet that you are positive works.

If that doesn't help, you can order a new power supply from a number of
places. There are a couple of places that sell them here in the US. Good
luck!

Oh, if you have a friend who has a good knowledge of electronics, the power
supply should be relatively easy to fix, though it is probably not worth
the standard (astronomical) costs that most formal repair places would
charge.

While I agree that most run-of-the-mill PC keyboards have this demonic
influence, you can buy PC keyboards that allow you to select where
control/alt/capslock are (they come with extra keycaps, and usually are
dipswitch set). These are the more expensive units, typically.

> Z-Modem but Z-Modem isn't built in to Flash 1.60. Is Z-Modem built into
> Flash 2 like X-Modem and Y-Modem Batch was in Flash 1.60?

Yes, Flash II *fully* supports VT100 (as well as VT101, 102, 200 & 300) as
well as ANSI. An added benefit to our ANSI support is the built-in
IBM/ANSI character set so that you get full ANSI graphics displayed when
calling an ANSI BBS. We also support ANSI colors, up to 16 of them
depending on the type of Atari computer you're using.

> Also, does anyone have an inexpensive, complete copy of Flash 2 for sale?

If you own an old version of Antic's Flash, you can upgrade to Flash II
for only $30 + $4 shipping (in North Americ). That's one heck of a good
bargain!

> Also, does anyone know what is the current version of Flash 2?

Our current release is 2.21.

> Also, does anyone know the Quality of Flash 2's Manual? And how big of a
> Manual is it and how many pages?

We like to think our manual is one of the best telecom program user manual
around. It's grown to over 250 pages and includes 9 chapters, a full
Table of Contents and a large and easy to use Index for cross referencing.

If anyone else has any questions, please feel free to ask. Thanks.

6012. Re: C++ Library and header files

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-10 04:11:23 UTC
From: coutu@mv.mv.com
Message-ID: <Cz1AB0.or@mv.mv.com>
Source record: 29374

Thanks for the helpful tips! I obtained the g++ include and library files. Before I merrily dumped the include files into /usr/include I checked the file names to see if any already existing fils would be overwritten. As it turns out stdio.h would have been overwritten! So I fired up g++ in verbose mode and saw that it would also search in the directory /gnu/g++-inc for header files. So I made that directory and moved the files there with the regular C header files still in /usr/include.

My question to you all is this: Is this necessary? It it a good idea to keep them separate? Or can I drop the C++ version of stdio.h into /usr/include and still have my C programs build correctly? (seems unlikely)

I saw that someone is working with gcc 2.6.1. Guess I'll track that down too since I'm using 2.5.8.

As a truly fanatic Gulam user I tried Mupfel both stand-alone and under Gemini,

Mupfel without running Gemini.

6014. TOS 3.06 needed

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-10 08:49:18 UTC
From: acounis@lpnhp3.in2p3.fr
Message-ID: <39smqe$gaq@ccpnws.in2p3.fr>
Source record: 29380
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I am currently building a PAK3 accelerator board (68020@16Mhz) for my
MegaST computer and I need a Tos 3.06 if I want to put the system on
the PAK.
As the Atari market is nearly dead in France (don't know if they ever
sold one TT!), I am looking for someone who could send me an image
file of the TOS 3.06.
Thanks for any help.

You can use HD disks in a non-HD drive fine. However, it is
strongly recommended that you not reformat an already HD-formatted
disk to a lesser density (or vice versa) -- and that includes, of
course, pre-formatted disks!

6017. WANTED: Cable for Navarone Cart to Scanner!!

Yes - but what I mean is that mupfel all on it's own is a very good command line, with most of the built ins of gulam, but more OS friendly. You don't have to run Gemini to use mupfel.....

6019. Minix

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-10 11:03:11 UTC
From: apb25@cam.ac.uk
Message-ID: <apb25.1.000B0DF0@cam.ac.uk>
Source record: 29383

Can I set up a Minix partition that replaces 3 normal paritions in one go (I am using ICD Link software) ?

What happens about caching - I hear that "Turbo" mode has caching", but can it cache everything but the floppy on both read and writes. Alternatively, can the ICD stuff cache the Minix partition? The ICD cache is really good - loads of useful options, I hope that Minix.xfs is worth it.

Also, to use the Minix partition, I will have to install MiNT. What is the best option for this - ie use the present (0.96) binary, or compile the source for 1.11 (if someone will tell me where there are instructions on how to do this if you are sensible, but know NOTHING about C). Will this:
slow the computer down?
use loads of memory?
still be compatible with most stuff?

Many thanks

Adrian Bridgett

RTFM! No, but seriously, try the HD-manual and look for a DIP-switch
that controls this kind of behaviour. There _should_ be one if it
isn't software-controlled in which case you also should find all the
necessary information in the manual. If you didn't get a manual with
the drive then you should try calling Seagate up. I'm sure they
have some kind of technical help-line (probably on a 800-number in
the US which is impossible to reach from Finland ;-).

Maybe someone could provide the phone-# to Seagate's technical
help-line (or similar).

I have seen similar problems on SCSI when the drive was not terminated, the
drive would shut down after half a minute. There are usually a few jumpers
to select the terminator & terminator powering options, you need the
installation manual that comes with the drive.

Did you have a look at times(3)?

Synopsis:
#include <sys/times.h>
clock_t times(struct tms *buffer);

The reported user and system times have type clock_t, the number of
clockticks per second is available in CLK_TCK (the actual value is
system dependant).

6026. It's a Drag (Question for TOS 4.04 Wizards)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-11 00:46:08 UTC
From: contacts@mits.mdata.fi
Message-ID: <39uesg$5c0@prime.mdata.fi>
Source record: 29194

Here's my problem: In my earlier machine, Mega ST 4 with TOS 1.04, I could drag several files over e.g. Gemview icon, and Gemview loaded all those files nicely after program start. Same Multi-drag is working in new Gemini (also in TOS 4.04).

But, in Falcon TOS 4.04 Desktop I have not found a way to do it. If I drag several files over Gemview it opens only the first one. I've tried all sorts of Install Application -settings, but with no luck.

If someone could tell me what's going on, I'd buy him a beer (If he ever happened to visit Finland).

While we have made the program 100% GEM compatible, we've also been working really hard on speeding things up. Our current version, 2.21, with a good screen accelerator like Warp 9, easily keeps up at 9600 baud.

> NOTE: Alan Page did not have any thing good to say about FLASH 2, his
> comments was that it still had some of the flaws that Flash 1.6 has...

Alan Page only saw the original release of Flash II back in 1992. It's come a long way since then. One must also keep in mind that Alan Page, at the time, was working on his own new telecom program, Storm, which was to have been a commercial product. It never made it that far. It was released as shareware, but has quite a number of bugs in it, and is mostly non-supported. Our product is fully supported on all of the major commercial bulletin boards as well as here! :-)

If anyone is interested in the program, they should download the latest demo, 2.21.

Yeah Ben, it should do it. I am running 2 hard drives that I installed in a Tower with it and ICD Utilities. You simply daisy chain em, be sure to set the Id number on each drive and disable the parity on the last drive. (your hard drive manual should show you where these functions are located)

> in the Internet?

To connect a SCSI harddisk to your Atari, you need a host adaptor
which plugs into the DMA port. There are still quite a few companies
marketing their host adaptors, especially in Germany. Just take
a look at the ads in a recent ST-Computer issue, and you'll find
a larger choice of hardware than you might wish. Once you have
a host adaptor, a housing, power supply, formatting software,
and some cables, you can buy just about any SCSI disk on the market.
Usually you buy a bundle of all these things. Make sure that the
product you're purchasing is expandable, i.e. you can add a second
hard disk/ removable hard disk / other SCSI devices later.

Since a lot of people give up on Atari these days, there should
also be a large number of offerings of cheap used equipment.
Check out the ads in ST-Computer, in the German MausNet, or in
a second-hand magazine such as the German "Computer-Flohmarkt".

Out of the 5 or 6 STE's that I have had the cover off, 3 of them were fitted
with HD drives, HD drives will format HD disks at DD formats....

DD Drives don't have the high output Heads to format HD disks correctly..

So PLEASE DON'T USE HD Disks on a DD Drive, they will fail, FACTS...

I didn't know you could do it in TOS 1.04, it doesn't work in 2.06 either. Why did they get rid of this useful feature. Although it is back in MultiTOS (when they release a usable version...)

I had thought of starting that myself. When I get mint-net to work (this involves getting Mint 1.11 working, something I've yet to manage) I'll have a go.

>ftp, telnet, ntalk, ping, www browser, smtp, nntp, finger and a control
^^^^^^^^^^^
I think there is a text based lynx-port. Making a graphical version based on this might be easier than starting from scratch.

>program to handle setting up PLIP, SLIP and PPP connections etc.

Particularly since there is otherwise no way to do this - currently you have to dial up with a terminal package AIUI.

>Could anyone who is interested in joining in or who is already involved in
>doing something similar please contact me?

I was going to write a graphical ftp client. Yes, that's hard but I was going to cheat and pipe to and from the text based one!

6034. HD-floppy on Mega-STE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-11 12:17:50 UTC
From: dat91fhu@ludat.lth.se
Message-ID: <39vnde$88e@nic.lth.se>
Source record: 29221

I have a Mega-STE bought in Germany with German TOS 2.05. I recently uppgraded the TOS to Swedish 2.06, no problem. Now I happen to have a HD-drive and I would love to put it in the machine AND be able to use it. Does anybody know what it takes to get it working? Preferably without an expensive kit.

BTW, I installed the HD-prog which came with TOS 2.06 and got the High-Density button in the format-dialog, and of course I had to try to format a HD, and of course it didn't work. No wonder since I hadn't changed the drive, but if you're a trial-and-error-die-hard you are... :-)

/HUGO.

There is one problem (that I know of) with formatting high density disks
to lower density; if you do it on an IBM, it will format the disk as
"half of a 1.44" instead of 720K. The difference is subtle, but very
annoying when you pop the disk into a IBM compatile and it tells you
that there are missing sectors on the disk... This problem with
formatting will only occur with HD disks, though. When I put my
720K disk in and formatted it, it works everywhere.

6037. Programming a MIDI sequencer

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-11 17:12:21 UTC
From: slh100@tower.york.ac.uk
Message-ID: <Pine.SGI.3.90.941111170612.3253B-100000@tower.york.ac.uk>
Source record: 29199

Hi.
I am working on a program to process MIDI data in real time (a sort of computer composition tool) and I would appreciate some advice on how to handle the MIDI I/O. Basically I need to play back recorded MIDI data and possibly also record MIDI input, like in a sequencer.

I assume that for playback I need to use an interrupt routine, but which one? I would guess that the vertical blank interrupt is too slow for accurate timings: are there any other regular timer interrupts? Also, I suspect that calling the Xbios Bconout() function in an interrupt handler is not a good idea, so how do I pass data out of the MIDI port? Similarly, for MIDI input is it possible to intercept the data directly as it arrives at the MIDI port rather than using Bconin() to read it?

If anyone could advise me the best way to go about this, or point me towards some source code for a working sequencer, I would be extremely grateful.

Shawn Hargreaves "God is real, unless declared as integer."

Here are some instructions on how to do this. Please note that opening a monitor requires some SERIOUS caution, as there are components in there that can hold a LETHAL charge for quite some time, even if the unit is unplugged! Use plastic adjustment tools, stick your other hand in your pocket, and be very careful.

---being included hunk---

HOW TO ENLARGE YOUR
SM124
MONOCHROME MONITOR'S
SCREEN SIZE

by
Jack P. Durre'

If you've used the Atari ST computers with the SM124 monochrome monitor, chances are quite good that you have come to accept the wide (black or white) border surrounding the usable area of the screen. You may have asked "why?", but probably only grumbled about it, and went back to work. If you've got the time (about 15 minutes, on average), the tools (3 or 4, and available from most Radio Shack stores), and the nerve (very little required!), this article will explain how you can actually have a LARGER, usable screen (as compared to the Mac)!

First, credit where credit is due...The original information for this modification came from the April, 1986 issue of "ST APPLICATIONS" magazine, in an article written by Albert Lew. I am merely explaining my own methods, following the original steps as outlined in Mr. Lew's article.

That said, let's get the caveats out of the way: While I may personally consider the following modifications to be simple and straightforward, I can't write a "Hello World" program in BASIC!!! In other words, what may be "simple" for me, may be quite difficult for you. If you feel that you are NOT qualified to make these modifications, DON'T! Find an able (and willing!) friend or service technician to do it for you, or forget the whole idea, and live with what you've got! If your monitor is in

warranty, opening the case will, obviously, void that, and the possibility also exists that even if you wind up paying for repairs, the technician MAY refuse to work on your machine! (Chances are, however, that he's more likely to want to know more about making the mods himself!) Further, the electrical current coming from the wall plug is enough to knock you silly, or worse, and inside of the monitor case, it gets even stronger, so be aware that touching the wrong thing may well put you into an "endless loop" of your own! In other words, YOU CAN GET KILLED! Now, if you've decided that you'd "kill to have a larger screen", then follow me!

Tools: These are really few in number, and quite simple to come by. Mr. Lew suggested some non-TV type of tools, but I'm going to stick to my guns here, and insist that you use the right tools for the job! You'll need a Phillips screwdriver, preferably a #1 size. (If you don't know the difference between a Phillips, and a slotted-head screwdriver, let me stop you right here, and suggest that you return to your programming!) You'll also need two TV "tuning tools"; a hex-tool, 3/32" ("across the flats", as they say) and a flat-bladed tool, 1/8" or so in blade width. Both of these tools should be made of non-conductive (plastic) material, and longer is better! A make-up mirror is also quite handy, particularly a free-standing one. I might also suggest a thick towel or other material to protect the face of your monitor and the top of your desk, during the time that you are moving it around. Finally, the toughest item of all...some CLEAR SPACE! You'll need to move the monitor around a little, and of course, it will need to be connected to your CPU (and I DON'T recommend trying to balance it in your lap!), so plan accordingly.

Next, let's try to orient ourselves, so that you aren't amputating the screen, while I am talking about the power cord! The "front" of the monitor is the viewing screen, the "rear" is where the power cord, and CPU/Monitor connector cable exit the case. Since we're going to turn the entire thing around, so that the screen is facing AWAY from us, "right" will now be the side where the speaker is located, and "left" obviously (it IS, isn't it?) will be opposite that, where the control knobs are. "Top" will still be in its usual location, and if you haven't already figured out where the bottom is, it's time for another cup of coffee!!!

Ready? Here we go!

Boot your system, using either the desktop, with one or more windows opened, or call up a text file. The ideal situation is to have text reaching all four corners of the screen, so that you will be able to compare from one area to another.

Now, unplug the monitor's power cord from the socket in the cabinet, and turn the monitor around, so that the rear of the case

is facing you. Place the towel or padding on the desktop in front of the monitor, and tip the entire unit up onto the glass face (carefully!). Now, using the Phillips screwdriver, remove the 5 screws holding the cabinet together. (Two on the bottom, one on each side, about 3/4s of the way up, and one just above the power cable socket.) Once these have been removed, put them somewhere safely out of the way, and don't worry about mixing them up, they're all the same size. Now, gently lift straight upwards on the rear sides of the case, and it should begin to lift away...CAREFUL! You have yet to disconnect the speaker wires, and there's not too much extra wire here. See it? Carefully reach down to the connector where it joins with the mother board, and pull it straight away from the board, disconnecting it. Don't be too concerned about the orientation of the plug, as it will work in either direction. Once you've done this, continue to lift the rear section of the cabinet away, feeding the CPU/Monitor cable through the opening as necessary.

Set the cabinet out of the way (And don't STEP ON IT!), and proceed with the REAL modifications! Tip the monitor back down to its bottom, and arrange the mirror so that you can see the screen while working at the rear of the unit. Re-connect the power cord, and turn on the monitor, being careful to NOT stick your fingers inside the wrong areas!

Grab your plastic flat-blade tool, and start looking along the right side of the mother board (remember now, we're looking from the rear of the set!). Near the front of the board, neatly tucked between the picture tube, or CRT, and a vertical metal heatsink/power board, is a row of 3 white adjustable controls, or potentiometers, about 1/2" in diameter, labelled "VLINE", "VSIZE", and "VHOLD". We're interested in "VSIZE", which is the middle control "pot". (NOW you know why I suggested a long tuning tool!) Gently slip the tool into the slotted head of the pot, and while watching the screen in the mirror (you DID boot up the system, didn't you?), begin to turn the tool slightly (try not to apply much pressure to the pot, as that CAN effect the setting). The top and bottom of the screen will begin to move, together or apart! Expand the screen to within approximately 1/2" - 3/4" of the top and bottom of the "bezel", or plastic frame on the front of the monitor. (Too close to the bezel, and you'll find that you have to be EXACTLY in front of the screen, or miss some of the information!)

See? Feeling more confident already, aren't we?

Moving right along, we will now swap our tuning tools, opting for the hex-shaped one. Looking near the left rear corner of the mother board, close to the point where the power cord socket is located, you will find a plastic shaft with a slot in it, sticking straight up from the board, and just slightly ahead of that, a

strange-looking device, composed of a small-diameter tube, with what appears to be a couple of "bobbins" of wire on it. Inside of that small tube, there is a small, somewhat-fragile core of graphite, which WILL break, if mistreated, so act accordingly! Gently lower your hex-tool into this tube, and you will feel it slide home into the core. (Again, don't press down on the core.) By turning this core in a clockwise direction, and watching the mirror, you will see the screen shrink slightly first, and then grow WIDER!!! (Now we're really starting to cook!) Remember to leave about 1/2" - 3/4" border, to avoid having the edges hidden by the bezel.

What's that you say? Your picture got larger, but it looks off-center? Well, cheer up, bunkie, 'cause we're gonna fix THAT right now!

See that big chunk of glass up front? Well, it has a "neck" on it, and the back end is pointing directly at us, with some strange looking electronic stuff along the way. At the very back of the tube are some electrical connections, but we're not worried about them...what we're after are the two magnets that look sorta like "Q"s around the neck, about 1-2 inches forward of the connections. See 'em? They're dark grey or black, probably, and have a little "ear" sticking up away from the tube, so that you can gently push them around until you get the picture centered on the face of the CRT. Don't worry about touching THEM...just try to keep from resting your hands on any "hot" contacts! This may take a little time to screw up your courage, but once you get the hang of it, you'll find it quite easy! Once you've got the picture fairly well centered, you may need to go back and re-adjust the VSIZE or Horizontal size, as all of these things are interrelated.

Next, we're gonna make the picture sharp again, in case you're worried that you've just lost that beautiful screen that you love so much!

Remember the slotted plastic shaft at the left rear of the mother board? Well, THAT's the "FOCUS" control, and if you'll again resort to the flat-bladed tuning tool, you can use that control to find the best compromise for YOUR taste! Atari chose to go for a tack-sharp center screen, and let the corners be a little softer in focus. You can do the same, or go for sharp corners and let the center go a little soft, or shoot for some compromise. (Hey! Life's a compromise!) Once you've done this step, you can actually turn the set around, and admire your handiwork!

If you see some other minor fine-tuning that you want to go back and do, feel free. This is now a CUSTOM-TUNED monitor of the first rank, and you will have even more pride in your ST than before!

To reassemble the cabinet, turn off the power, slide the CPU/Monitor cable through the rear cabinet section, and with your third hand...yep, gotta remember to reconnect the speaker leads! There IS a sort of indicator as to which way the plug was originally connected...One side has two slots, and the other side has only one, but the speaker WILL work even if this connector is reversed. Incidentally, if you want to go one step further, Mr. Lew suggests the addition of an Audio-OUT connector from this lead. Your choice.

Finally, having reassembled the cabinet, re-connect the monitor to the CPU, boot the system up, and check out the BIG PICTURE!!! If you have any problems, check first, to see that power is reaching the set, and that the green LED indicator is on. If not, you may not have reconnected the power cord securely, or possibly a fuse has blown or been broken (fuses are located on the vertical power board at the side, near the VSIZE pot, and easily replaced from Radio Shack).

Enjoy your "new" monitor, and if you have any questions on this modification, you can reach me here, on CompuServe, at PPN 75046,476.

Seeya! [Jack]

6044. Dead Hard Drive? :(

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-12 05:57:05 UTC
From: aspect@cats.ucsc.edu
Message-ID: <3a1lfh$9nk@darkstar.UCSC.EDU>
Source record: 29209

I think my SCSI hard drvie died recently. When I boot, it makes a small noise and ADHI half recognizes the drive - it prints the model number, but not the detailed information it would after (similar message as if the drive were unformatted) HDX (oh, this is all Falcon release software) sees the drive buit won't format or partition it. SOunds badm I know...

THe thiung is, I used to gwet this p[roblem intermittently but a few reboots would fix it. Now it seems to happen all the time on my poor external SCSI box. Is this a sure sign of drive death? It's nearly 3 years old.

And, if it is dead, is there any hope of bringing it back to life long enough to snag important files? I've already bought a new 540 megger to replace it but would like to get some of the files. sigh.

I believe that there is a seperate box and keyboard for the falcon.
But is there a bus adaptor which allows two cards e.g a PC and 040 card
at the same time?

If this was availble it might make it more sensible to upgrade to a three
box unit.

In the last two year here in the UK Apple Macs have become more apparent
on the high street. If Atari had done the sensible thing and kept the
Falcon at a lower price, put a monitor and some decent sofware with it
from day one perhaps we would have seen it as the 'next Multimedia system'
after all it has everything already their, dsp, lan multitasking etc.

With a bit of marketing and the taking of a few risks I am SURE the
Falcon would have sold by the ton, but thats Atari for you.

I just wish someone would buy out the Atari Computer line, improve
it slightly i.e put TOS 5 and an HD + 4meg as standard and then
we WOULD have Ataris on the high street.

Are their any risk takers out there who would do this? I know if I
had the money I would!!

Well, we can but dream...

6056. MiNT...I'm a newbie

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-12 21:40:11 UTC
From: Johnny C Lam <jlbg+@andrew.cmu.edu>
Message-ID: <YilHMvG00iVCQ4BIoT@andrew.cmu.edu>
Source record: 29224

I am looking for help...I just installed MiNT...on a Mac. I was looking
for a UNIX-like file system, and I found this, which looks really good.
It's exactly what I want I think. But I have a lot of questions:

First off, is there a newsgroup or discussion group for MiNT? If
there is, I'll stop posting here and spare you all the questions of a
newbie.

I am in the middle of installing man...but I need to get a few
utilities first: cat, nroff, troff, and some others. Is there a
convenient place I can find all this? I have looked at the UMich Atari
Archive, and I didn't find these utilities. Is there a site to find
other ported UNIX utilities (I am on AFS if that helps)?
Where do I find chown? It's in a lot of my shell scripts, but I
don't have it.
What is the latest version of MiNT, and it's advantages over version 1.08?
What is Minix?
What version of the MiNTnet works with version 1.08 of MiNT?

That's all for now...I'll wait and see if someone tells me that there is
a MiNT newsgroup. I'm subscribed to this newsgroup, but you can just
reply to my account: jlbg@andrew.cmu.edu.

Thanks!

6057. gcc problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-12 23:00:29 UTC
From: ralunsfo@uncc.edu
Message-ID: <3a3hed$382@news.uncc.edu>
Source record: 29228

I am having problems getting GNU C to compile correctly. If I type

gcc test.c I get the following responses, depending on how my source looks.

If my source file contains the function main():
tmp.o: undefined symbol __main referenced from text

OR

if trying to compile with hello() function in program
main.o: undefined symbol _main referenced from text
I have all the libs and headers (not positive they're in the right place, but shouldn't matter as I have their locations declared in MINT.CNF)...any ideas?

Thanks,
Russ

PS..when I try to compile MiNT sources in Lattice C, I keep getting 'Pre-compiled header file MINT.SYM not found'..where does that come from?

: >I've tried all sorts of Install Application -settings, but with no luck.

I use Selectric with GemView which does what you ask for very nicely.

Also, I think there are patches from CodeHead and Trace Technologies
which fix TOS 4.04 file routines.

>
> I don't know the details of the GFA get format, but as far as
>the image data itself, you simply need to duplicate each word as many times
>as you have bitplanes.
>

The proper way to convert bitmap images from a single plane form to
a multi-plane form is to use the vrt_cpfm() call (not vro_cpyfm()).
vrt_cpyfm() works on vdi handles, memory buffers, and vdi memory devices,
and even printer and plotter vdi handles - and the memory buffer could
be the physical screen address, but please use a VDI handle.

The vro_cpyfm() performs a standard bit-blit raster copy, except that
it automatically writes the output form in any color you want (this
is how GEM icons are drawn - which is why they can be any SINGLE color).

The call is as follows :
control array :
0 121
1 4
3 3
6 vdi handle
7 high word of source form address
8 low word " " " "
9 high word of dest form address
10 low word " " " "
intin array:
0 mode
1 colors[0];
2 colors[1];
ptsin array - ptsin is just your pxy array that holds the points that
make up the blit boundary for the call. Source points first (x1,y1,x2,y2)
then destination (these rectangles must be the same size).

The forms are defined as so :
typedef struct {
VOID * fd_addr; // address of buffer to hold data
WORD fd_width; // width of form in pixels
WORD fd_height; // height of form in pixels
WORD fd_wdwidth; // width of form in WORDS

```
WORD fd_stand; // 0 = device specific 1= VDI
WORD fd_planes; // Number of planes
WORD reserved1, reserved2, reserved3;
} MFDB

Colors[0] is the color of all set bits
Colors[1] is the color of all clear bits

Mode is he VDI writing mode. 3 for replace, 4 for erase, 6 for XOR,
and find a table for the rest :-)

6061. A Kick in the pants

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-13 05:39:20 UTC
From: ekl@sdf.saomai.org
Message-ID: <Cz6yDs.2rI@sdf.saomai.org>
Source record: 29136
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I'd like to give my system a kick-in-the-pants. Currently I'm looking for information and a Zyxel 19.2K modem U1496+E (at least I think that is the right model number). If you have such a modem and would be willing to sell it, give me your price, exact model number and ROM revision, and asking price in US dollars (including shipping and COD to Texas, USA).

Now, the information I'm seeking :

I want more information on something called the MegaBoard - it supposedly allows an ST user to add an additional 8MB of RAM, an IDE hard disk interface, and an ISA card slot suitable for graphics cards such as an ET4000 or similar. I want price (US dollars, availability information, and what the installation is like - will it wire onto the same motherboard as an STe AdSpeed? On the STe at all?)

Next, the GE-Soft Eagle Sonic was released. A TT clone with a 33Mhz 68040 CPU (66Mhz internal). I want to know video resolutions, RAM, bus speeds, upgradability, case designs, availability, hard disk types supported, typical hard disk and memory configurations, serial ports and which chips are used for serial IO, and anything else you can tell me. I'd like prices in US Dollars for a bare system, and one with 4-8MB RAM and a 240MB hard disk. I want all the technical and financial details you can get to me!

Last, I heard the Medusa T60 was released, I'd like the same info as above, but also CPU speed infor for both the 040 and 060 versions of the Medusa system, same configurations and such as above.

Oh, and if anyone has a used TT030 they would like to sell a couple months down the road, drop me an e-mail about how much you would want for it, and complete details on the system.

Thanks,
Evan Langlois

They all should be in Umich. You find cat in one archive (txtutils or
something like that) in GNU directory. Troff is in groff (groffbin &
groffvar) and nroff is also there.

> Where do I find chown? It's in a lot of my shell scripts, but I
>don't have it.

If I recall right, I founded it from fileutils. Again search it from
GNUutils or something like that.

Woah woah woah there! You _can't_ put the C++ headers int he same
directory as the regular C++ headers!

>fired up g++ in verbose mode and saw that it would also search in the
>directory /gnu/g++-inc for header files. So I made that directory and
>moved the files there with the regular C header files still in /usr/include.

Whew, that's more like it.

>My question to you all is this: Is this necessary? It it a good idea to
>keep them separate? Or can I drop the C++ version of stdio.h into
>/usr/include and still have my C programs build correctly? (seems unlikely)

You _must_ keep them separate.

>I saw that someone is working with gcc 2.6.1. Guess I'll track that down
>too since I'm using 2.5.8.

Doesn't seem to have been released yet. I'm hoping it'll be released
with the new binutils, and a nicer way of handling all those libraries
(bammi hinted at this a while back when I dropped some cross-compiler
patches on him).

I'd much rather have something nice, like this:

.../lib/all '000 libs
/short/all '000, -mshort libs
/020/all -m68020 libs
/020short/all -m68020, -mbaserel libs
/shared/all '000, -mbaserel libs
/020shared/all -m68020, -mbaserel libs
/sharedshort/all '000, -mshort, -mbaserel libs
/020sharedshort/all -m68020, -mshort, -mbaserel libs

I guess you'd have to kludge it up for TOS filesystems though:

.../lib/
/16
/020
/02016
/b
/020b

/b16
/020b16

but that isn't very readable. It's still nicer than what we've got now,
though.

>or something similar. is the parition too big (I seem to recall something
>about a 256 meg limit at some point...) If so, I'll simply repartition.

The limit is actually 8K logical sector sizes, which yields a 256 Mb max
partition under Atari's formatter and 512 Mb under intellegent ones.
This is a result of the max legal sector size at the time the last
version of Diamond Edge was released(2 years or so ago). We will be
releasing the the first major upgrade to Diamond Edge in over two years
in a month or so. The 8K sector size limit is no longer there.

Sincerely yours,

Bob Luneski

Writing code to work on an ET4000 should be a very simple port I agree, but
doesn't the ET4000 do hardware blits etc? In which case you would need to
write more code to get the best performance from it.

As it currently uses the bios Lrwabs() for disc access it will use ICD's cache
anyway.

>Also, to use the Minix partition, I will have to install MiNT. What is the
>best option for this - ie use the present (0.96) binary, or compile the source
>for 1.11 (if someone will tell me where there are instructions on how to do
>this if you are sensible, but know NOTHING about C).

If all you want to do is run minixfs, you could use the 0.95 binary, which
although slower than later ones does work.

The source for 1.11 is not supposed to be available, you have
to get the patches and apply them yourself, which is not easy. Then you have
to set up gcc and make and compile everything with that; if you can get the
resulting binary to do anything other than hang you're doing better than me.

> Will this: slow the computer down?

Not significantly, and it will be faster on some operations.

>use loads of memory?

It uses a hundred k or so.

>still be compatible with most stuff?

Most well written stuff will work fine. Don't expect games to work, but
you probably run most of them off a floppy anyway.

>: >If I drag several files over Gemview it opens only the first one.
>: >I've tried all sorts of Install Application -settings, but with no luck.

>I use Selectric with GemView which does what you ask for very nicely.

It won't let you drag lots of files over the icon from the desktop, which you apparently can with TOS 1.04, or with most alternative desktops. But the ability to select multiple files from the file selector in selectric is very useful.

>Also, I think there are patches from CodeHead and Trace Technologies
>which fix TOS 4.04 file routines.

They fix a bug and reintroduce a 'feature' of older tos versions; they don't affect the behaviour of the desktop in this way.

>other ported UNIX utilities (I am on AFS if that helps)?

Have a look in the mint distribution kit.

> What is the latest version of MiNT, and it's advantages over version 1.08?

1.11h2. I don't know what it's advantages are as I've yet to get it working.

> What is Minix?

Minix is a unix clone for the atari (and some other computers); there is a
file system driver for mint which lets you use it's file system instead of the
atari's normal horrible 8+3 one.

> What version of the MiNTnet works with version 1.08 of MiNT?

None AFAIK. You need Mint 1.10h8 or later.

>Doesn't Warwick's GEM++ (somewhere on atari.archive) do that? I know
>he's got a nice custom rsrc_load() in there.

I think (from reading the German Interface manual), there are two
kinds of 'long' RSC files. The first is the Atari one, where the CICON
extensions can be stored after the first 64K, and which AES 4.0 can
read using rsrc_load(); whilst the other simply uses long pointers
instead of short ones in the file, and hence handles the CICONs in the
same way as normal objects. I could be wrong about this, I haven't
tried looking at the source code that came with Interface yet...

6082. Jag Joypad (C Code)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-14 15:54:51 UTC
From: andrew@minster.york.ac.uk
Message-ID: <784828491.20884@minster.york.ac.uk>
Source record: 29143

Hi, I noticed that a few people were wondering how to read the enhanced joypad port on the Falcon. I have some code which will read the jaguar controller and it follows at the end of this article. It is written in Lattice C (v.5) and should give you some indication of how to write your own code. If you want any help or advice about this code please feel free to e-mail me.

If you use this code or find it useful then e-mail me. We can compare notes.

It's not to big, as i got an partition over 400 megs, and diamond edge is
running just fine. I have no idea what could be the problem. Maybe a reformat
will do the job.

Upoint can not do that since it's an UUCP program.

I don't know what programs can do it. Maybe Popmail or something simular.

Hi.

There are cartridgesm such as the ForgetMeClock, which plug into the
cartridge slot on the left side of your ST, which have a battery, and can store the time.
They usually come with a little AUTO program which copies the time data into
memory.

Some Hard Disks also include a clock, but this is going to extremes if you
just want the time to be saved.

Most cartridges include a through-port, so that other cartridge devices can
be plugged in as well as the clock cartridge.

Hope I've been of some help.

> I assume that for playback I need to use an interrupt routine, but which
> one? I would guess that the vertical blank interrupt is too slow for
> accurate timings: are there any other regular timer interrupts?

I use Timer A. I generated a lookup table for the optimal numbers to stuff
in timerA registers for each tempo (30-240bpm at 240ppqn). This is much more
accurate than any TOS interrupt but it does use the last free timer.

> Also, I
> suspect that calling the Xbios Bconout() function in an interrupt
> handler is not a good idea, so how do I pass data out of the MIDI port?

Depends - if you're prepared to do a busy wait, you just wait for the tx empty
flag on the MIDI ACIA chip and then stuff your byte into the output register.
Busy waiting is usually a bad idea. The alternative is to enable the tx empty
interrupts - but this opens a whole can of worms (see below). Also you need to
pass responsibility for sending the next byte between the timer interrupt routine
(if waiting for next MIDI event to occur) and the tx empty interrupt routine
(if waiting for the last byte to finish transmitting).
The realtime core of a sequencer is typically a rats nest of interrupt routines,
flags and semaphores.

> Similarly, for MIDI input is it possible to intercept the data directly
> as it arrives at the MIDI port rather than using Bconin() to read it?

Handling MIDI interrupts is non-trivial because:
(1) The MIDI interrupt vector is shared with the IKBD
(2) Various TOS routines (including the IKBD handler!) lock out interrupts for
long enough to drop MIDI bytes.
Incidently I tried to make TOS 1.62 drop MIDI bytes a while back and it doesn't!
-even though a "naive" custom interrupt handler does lose bytes due to interrupt
lock out. I suspect Atari have identified the critical routines and inserted
extra tests on the MIDI ACIA inside such routines to fix the problem.

6092. Falcon SCSI Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-15 03:17:39 UTC
From: Jay T Millar <jmillar@delphi.com>
Message-ID: <x6x0EA7.jmillar@delphi.com>
Source record: 29145

Hi all,

I hope someone can help me with a problem I'm having with SCSI HD access on my Falcon. I recently bought an external case and a Quantum 50M HD bare mech so I could play around with Linux. Having never really dealt with HDs on the Atari (except for the prepackaged 80M Connor drive that came with the Falcon), I was somewhat hesistant, but I'm not completely incompetent, so I decided to forge ahead. :)

In any case, I managed to set the SCSI ID of the drive correctly, get it recognized by the Atari's HD driver software, format and partition the thing, and finally, read and write files. Unfortunately, however, during read and/or write access on this drive, in SOME cases, the system will hang. In other words, during a read/write, the drive will freeze in the middle of the transaction, hanging the system. I haven't been able to recreate this situation under any particular circumstance, it just seems to happen at random. Am I using an outdated driver? (using AHDI 6.0, I think) Is there something else I'm missing? Any help would be greatly appreciated as it's really annoying.....

Anyways, once I get this thing working consistently, I hope to install Linux on it. Unfortunately I've only been able to boot the older version of the kernel, ask myself how it's better than MiNT (just kidding, of course), and then shutdown the system since I can't REALLY do anything with it! ;)

I'm anxiously awaiting 0.9pl4......Great work all. Take care.

: Out of the 5 or 6 STE's that I have had the cover off, 3 of them were fitted
: with HD drives, HD drives will format HD disks at DD formats....

: DD Drives don't have the high output Heads to format HD disks correctly..

: So PLEASE DON'T USE HD Disks on a DD Drive, they will fail, FACTS...

There's usually no problems at all connected with using DD-disk with
HD-drives and vice versa.
IBM stated a long time that formatting a HD-disk with DD-format would
destroy the disk, that is wrong, and they later took that statement back.
But there is a considerably risk of dataloss if you do so.
Because of the way HD-floppys work, and DD-floppys work, you can usually
without any problems reformat a HD-floppy previously formatted in
HD-format with DD-format, the other way around is also possible, but
could cause dataloss.

The difference between the two formats are that the HD-floppy writes the
tracks much 'thinner' than the DD-drive does, thus will a DD-drive easily
overwrite a previous HD-format without any risk of dataloss, while the
HD-floppy won't completely overwrite the DD-format.
The DD-format could then with a bit of bad luck influence the HD-format
in a bad way (the head picks up the DD-format together with the HD-format.).

A real cure for that isn't available, for obvious reasons, but it usually
will work just fine if you reformat the HD-disk a couple of times.

I have a lot of friends that makes HD-disk's out of their old DD-disk's by
making the extra little hole with the help of a drill. And it works perfectly
well for them, without them having to reformat the disk several times.

Regards, Tommy

Although I'm relaying this for someone else, any replies can be
sent to him through me (as he doesn't have any access to the internet or
usenet (no hard drive or fast modem)). Any and all help will be very
appreciated, thank you.

I'm building a flowcharting program using an object tree as a page
of the flowchart. The symbols are icons with children that are strings.
The lines are user-defined objects with no children. The parameter passed
to the routine to handle the user-defined object consists of a list of
objects to connect.

The first object is the orgin object. The rest of the list
contains the objects the first object is connected to. It also contains a
string that is the label for some of the lines (such as labeling a yes and
no branch in a decision).

The things that I need to know are:

- How to insert an object or objects into an object tree,
maintaining the rules for a GEM object tree (such as the
root object has to be the size of all the children,etc).
- The best way to delete an object in a tree.
- How to print an object tree keeping it compatible with
the majority of Ataris.
- How to save an object tree so that rsrc_load can
understand that it is a tree.
- Perhaps some fast drawing routines for symbols instead
of using icons for symbol representation.

Thanks in advance for anything you can give me,

Blaine Brysh

Thanks again for any help rendered.

Leslie

No, Turbo C was updated to Pure C (that is, Turbo C is "outdated" compared
to Pure C. Nevertheless, it's a very nice package!).

From: cm3hirjd@bs47c.staffs.ac.uk
Message-ID: <3aa12f$s5h@bs33n.staffs.ac.uk>
Source record: 29156

I am using HiSoft Basic 2.10
I am running it on an Atari Falcon030 with 4meg memory, VGA and hard drive.

All I want to do is show a NEO/PI1 picture with the correct palette in
one of the Falcon resolutions (ie 16 colour, 80 columns, double line off).
But it doesn't want to know about it, the example source code is rather
poor and doesn't actually work on the Falcon.

I have managed to get the picture on-screen but getting the palette is
not so easy, and once I DO have the palette changing the current one to
that of the picture is a nightmare! HiSoft Basic may be good for GEM
stuff but for graphics..... yuk :(

any help would be great (source code esp.)

From: der@discovery
Message-ID: <DER.94Nov15111431@discovery>
Source record: 29154

I've got a problem creating a really huge MinixFS partition:

System: Falcon (14Mb memory, 1.04Mb + 540Mb FS2-drives, 420Mb IDE-drive, CD-ROM and DAT-streamer) with SCSI-tools (HuSHI v6.05), MiNT v1.11h3 and MFS v0.60 PL10.

I have no problems creating a 1Gb partition with SCSI-tools, but Minit exits with an "illegal instruction" when trying to initialize it. Is it possible to have a 1Gb MFS-partition or do I need to reduce the size?

>Would it be possible to connect this to serial port on an XT PC and
>still get a 250k transfer rate?

Unless it's got an extra card in it there's no way the PC will keep up with that, if the serial port on the PC is the same age as the rest of it (ie when they still made XTs) it won't go anywhere near that fast.

>As I indicated in a pervious post I want to be able to:

> be used to run text applications on the F030.
> (I would like to be able to use various term
> windows at once)

That's easy enough to do, you run the program on the falcon with it's input and output redirected to the serial port. Of course having Mint is a good idea otherwise you won't be able to do anything else with the Falcon at the time.

Message-ID: <3aa6h4$2a8@kelly.teleport.com>
Source record: 29162
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've been playing Elite II and I've just bought a 2000+ Ton Panther Clipper. It came with a Class 8 HyperDrive. On my ship, it has a range of 9.15 LY per Jump. Unfortunately, that's not far enough. Does anyone know where I can find a Higher Class HyperDrive than Class 8. Usually the Highest Class you can buy in most Ports is Class 7. Mine came equipped with a Class 8 Drive. The Manual for Elite II says "Although the classes are listed upto 7, higher classes exist but are ONLY OBTAINABLE FROM SPECIALISTS.". What do they mean by specialists, who are they? Where do I find the specialists? And Where do I find the nearest ones to the SOL System?

Also, now that I have a Panther Clipper, what is the Point in continuing the Game. I've been told that in some systems, their are ships not listed in the Manual for sale. Are their larger ships to move upto than the Panther Clipper? Or have I peaked in this game? What ships are their? Where are they? I'm hoping for one with at least 8 missile Pylons, the bigger the better.

--Thanks--

You just load it into a buffer, call vs_color for each palette entry, then set up an MFDB and blit it onto the screen. This is the same as in any other language (although the MFDB structures are easier to handle in C).

>

Well if you use C sometimes and C++ other times you will need
to keep them seperate. And watch out if you are using a mix of
C and C++, i.e, some code is using printf and other stuff is
using the iostreams. If I remember correctly the FILE struct
is different between the two. I kept getting problems with
the library but recompiled it from the GNU sources sometime
ago and seem to fixed that problem.

>I saw that someone is working with gcc 2.6.1. Guess I'll track that down
>too since I'm using 2.5.8.

I have 2.6.0 up and running that is gcc, g++, cpp, cc1, cc1obj,
and cc1plus and libg++-2.6.1. I am currently applying the 2.6.1
patches to the compiler system and it should be ready by next
week.

Mind you I have only tested this running on a 16Mb Falcon,
using mintlibs44, it does require a Minix file partition.
Oh and the shell I am using is tcsh.

The C and C++ side seem to work 99.9% of the time I've only
had problems compiling two files from gdb-413 with
optimisation turned on - everything else I've tried has
compiled OK with or with optimisation. The Objective-C is
pretty much untested although it did compile its runtime
library (not much of a test I know).

The compilers are generating MIT syntax assembler. I don't
have anything that will assemble the MOTOROLO syntax at the
moment.

A.I.Nicholls@herts.ac.uk (Alex Nicholls) writes:

>Does anyone know how to get Extended GEM 2.10 to compile properly without any
>errors on GNU C? I can't seem to get it to compile..

You might ask Christian himself -- he supplied an email address in the docs
that come with the package. I don't use GC, so I can't help you I'm afraid.

>And is there any plans to make the Hypertext document english?!?

I asked Christian the same this week, and the answer was 'no'. Fortunately I
can read German so I personally don't mind :-), although I *do* think it's a
shame that this package will be somewhat esoteric to non-German readers.

And (plug) it *is* absolutely the best library I've seen in this field
(flying/non-modal dialogs, popups, etc, etc, too much to name).

I've been thinking about translating the docs to English, merely as a service
to Christian because he did such a great job, but I don't really feel like
tackling such a project -- the docs is 50+ pages, and I got some regular work
to do too, so probably no English version on short notice -- unless some other
freak would like to do the job... :-)

Aside: I converterd the docs into a Pure C helpfile -- i.e. just type
'X_Form_Do', press [HELP] and voila, you got a help-screen with
cross-references, etc. I wonder if there would be enough interest for such
a version of the docs to justify distribution (oh, also in German of course,
and only useful for Pure C users).

6110. MultiSync monitor advice needed (Falcon).

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-15 16:37:28 UTC
From: avsec@westminster.ac.uk
Message-ID: <CzBI6G.L7n@westminster.ac.uk>
Source record: 29093

I am about to buy a multisync monitor for my Falcon.
I was going to get a Microvitec but I have the chance to get a monitor at
an educational discount price.

What I want is the usual extended resolution (with screenblaster) but
especially an enhanced True colour mode (something like 640x480 non-interlace
if this is possible).

I can't remeber what frequencies the monitor needs to be to acheive decent
True colour modes so could someone check that the monitor below is OK.
(it says SVGA but has some sort of extended SVGA mode).

Here's the fella....

Viglen Envy 1415 - 14/15" SVGA colour monitor (non-interlaced quadsync).
Quadsync supports four ranges of HORIZONTAL FREQUENCIES:
31.5KHz, 35-38KHz, 47-49KHz and 56-58KHz.

VERTICAL FREQUENCIES:
56Hz, 60Hz, 70Hz and 72Hz.

The brochure also says that it supports all standard VGA, SVGA and ESVGA
modes. And, it is capable of 1024x768 non-interlaced.

Thanks in advance for the advice,
Phil-s.

6111. Help! MKS$ Format hell...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-15 16:50:39 UTC
From: bd@st-andrews.ac.uk
Message-ID: <3aaosv$poc@calvin.st-and.ac.uk>
Source record: 29164

Hi!
I'm trying to write a QWK program at the moment. I'd just like to thank everyone who sent me information on the QWK packet format.

However, having puzzled it all out, I'm still a bit stuck over the .NDX files. Iam aware that possibly I don't actually need these files, but I'd like to try to make my program as compatable as possible.

The part which has confused me is the part of the NDX file which refers to the offset for the message. I know that this is a real number in Microsoft MKS$ format, but I'm unsure how to go about converting this into an actual useable number.

HiSoft Basic uses an MKS$ format too, but it appears to be the Atari Basic MKS$ format, which (I think) has a different bit format.

I've managed to shuffle the bits around a bit, and I get the right numbers out, but I can't be sure that this will work with all numbers.

Any help appreciated.

Brian

np>I'm interested if someone knows how to save
np>time after turning computer off.
np>(Hardware solution, off course)
np>Through ROM modul port or something ..
np>
np> Any poniters, hints & tips would be appreciated ..

There is a ROM-modul avaliable, don't know where you can get it.
If you want to set the time in your computer on boot-up: I have
uploaded a file called PUTTIME5.ZIP to hensa. It allows you to set the
time and date on boot-up.(Don't think you can upload it yet)

I got the mint111h2 source from phlem.ph.kcl.ac.uk, it compiled using GNU C 2.5.8 and runs fine. I compiled the 68030 version as I'm using it on a TT.

6121. That darn '^C' keypress...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-16 00:10:41 UTC
From: lunman@ChamplainCollege.QC.CA
Message-ID: <3abim1$4qa@samuel.ChamplainCollege.QC.CA>
Source record: 29187

Howdy folks! I have yet another question regarding programming the ST.

I'm using Heat & Serve C. I'm programming a CLI. Here's the problem:

The following part WORKS:

Objective: I want a directory listing.
Action : I type "DIR" and press return.
Effect : I get a directory listing. (No problem!)

The next part IS a problem:

Objective: The listing is too long. I want to interrupt it.
Action : I press ^C.
Effect : My CLI quits COMPLETELY, and returns to GEM!

Surely, you see why I'm frustrated! It seems that when there is output
going to the screen, ^C causes the OS to think I want to abort the program!

How can I fix this? Can I disable the ^C handler? Can I reroute it to a
function within my program (Like in Borland C++)?

Thanks in advance for any info...

Jon

> Can this be done on a MegaST [no E] as well?

Well there isn't a spare ASCI/UART in the system. However it should be possible to hook up a Zilog SCC chip to the 68K bus so it was register compatible with the MSTE. Then TOS 2.06 or maybe even HSMODEM4 would be enough to bring it online.

(too compliacted for me though ;-)

:-)

Roland.

From the Holy Book of <3abim1$4qa@samuel.ChamplainCollege.QC.CA>
as spake by lunman@ChamplainCollege.QC.CA (Jon Lunman) :

>I'm using Heat & Serve C. I'm programming a CLI. Here's the problem:

[problem elided]

>Surely, you see why I'm frustrated! It seems that when there is output
>going to the screen, ^C causes the OS to think I want to abort the program!
>
>How can I fix this? Can I disable the ^C handler? Can I reroute it to a
>function within my program (Like in Borland C++)?

What you want is the signal() library routine. I don't know if dLibs
provides it, but the HSC MiNTlibs does. ^C is mapped to the signal
SIGINT, so you would proceed as follows:

```
#include <signal.h>

void handle_control_c(sig) int sig; { /* ... */ }

/* somewhere in your setup code */
signal(SIGINT, handle_control_c);
```

Then ^C will cause control to pass to your handler function. The int
parameter will contain the code for the signal that was intercepted, in
this case SIGINT. You can also do:

```
signal(SIGINT, SIG_IGN); /* Ignore ^C */
signal(SIGINT, SIG_DFL); /* Restore default ^C behavior */
```

6127. falcon Demo Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-16 05:04:04 UTC
From: ahuyghe@madwand.bison.mb.ca
Message-ID: <HLaVVc3w165w@madwand.bison.mb.ca>
Source record: 29031

Hello to all;

I have a question concerning some Demos i've been trying to run
unsuccessfully as of late. They are the Humans Demo, Plastik, Knockout
and the
latest is the obsession pinball demo. My problem is the same for all.
When i load the demo, the screen display is all garbled. Now i realize
that
some of these demos may be RGB and will not display on my system. Most of
these
do not have any file stating the video attributes. But i became suspect
today
when i loaded the obsession demo and witnessed the same problem. Only
this time
the read.me file states it will work on either RGB or VGA. So now i'm
stumped.
Is it the Demos or The system.
My system consists of a Falcon 030, 4 meg ram, 270 mb HD and a SVGA
monitor.
i usually run warp 9 v3.81.
I would appreciate any help or feedback from people who are able to run
these
demos with a SVGA monitor.

Thanks in advance.
Al Huyghe
ahuyghe@madwand.bison.mb.ca.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

] Also, now that I have a Panther Clipper, what is the Point in continuing
] the Game. I've been told that in some systems, their are ships not listed
] in the Manual for sale. Are their larger ships to move upto than the Panthe
] Clipper? Or have I peaked in this game? What ships are their? Where are the
] I'm hoping for one with at least 8 missile Pylons, the bigger the better.

All there is to do in the game after getting the biggest ships, is to
fly around, and kill bad-guys & complete missions to increase your
Elite and Federal/Imperial ratings. That's it! It gets very boring,
very quickly after gaining the powerful ships!

BTW - What's this garbage about Large Plasma Accelerators being used
for planetary assault!? I can't even obliterate a space-station with
one, although those space-ships that look like chocolate fish don't
last long! :)

Down in the imperial system you can get Imperial Couriers & Traders.
These are very fast ships, good for missions etc. Not too great
for money making due to the not-all-that-huge cargo space.

The Panter Clipper is the _largest_ ship in the entire game. Apart
from its limited warp-distance, it's the best. It is possible to stick
class 7 or above Military drives into it which increase its speed
somewhat. Most of the places to find huge drives are hundreds of light
years away from Sol.

To be perfectly correct, this line should read:

while (!((c1.num_pad & STAR) && (c1.num_pade & HASH))) {

but it doesn't make any difference to the important joypad reading code!
I was trying to be clever with Boolean algebra but didn't use my brain.

Just drop me a note if you want me to send you the helpfile. And if there are
more Dutch (or German) folx around who are able to translate German to English
we could even split up the docs in our translation-effort.
Prerequisite is that people are able to make a real good translation (I hate
'German' English, or 'English' German, etc) without spelling errors (the
thought of having to run into the same typo each time you ask for help on
subject X... &^%$*).

>What I want is the usual extended resolution (with screenblaster) but
>especially an enhanced True colour mode (something like 640x480 non-interlace
>if this is possible).

640x480 TC isn't possible anyway. The best you can get is 640x400 TC
interlaced, at TV rates, and that requires a multisync that can sync down to
15.625 kHz horizontal, which the one you have been offered certainly can't.

The one you have been offered is a fixed frequency SVGA monitor, not a
multisync at all; you will find it difficult to use blowup because of this.
Whether it's worth buying depends on how much of a discount you get I suppose.

This is standard control C DOES abort your program.

>How can I fix this? Can I disable the ^C handler? Can I reroute it to a
>function within my program (Like in Borland C++)?

Use control S and control Q (XON - XOFF) to stop and start the output to
the screen from a CLI.

6135. Re: MultiSync monitor advice needed (Falcon).

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-16 13:19:14 UTC
From: gaghon@nevada.edu
Message-ID: <3ad0si$gla@news.nevada.edu>
Source record: 29179

Philip Shore (avsec@westminster.ac.uk) wrote:
: I am about to buy a multisync monitor for my Falcon.
: I was going to get a Microvitec but I have the chance to get a monitor at
: an educational discount price.

: What I want is the usual extended resolution (with screenblaster) but
: especially an enhanced True colour mode (something like 640x480 non-interlace
: if this is possible).

: I can't remeber what frequencies the monitor needs to be to acheive decent
: True colour modes so could someone check that the monitor below is OK.
: (it says SVGA but has some sort of extended SVGA mode).

: Viglen Envy 1415 - 14/15" SVGA colour monitor (non-interlaced quadsync).
: Quadsync supports four ranges of HORIZONTAL FREQUENCIES:
: 31.5KHz, 35-38KHz, 47-49KHz and 56-58KHz.

: VERTICAL FREQUENCIES:
: 56Hz, 60Hz, 70Hz and 72Hz.

Ok, you can use that monitor for TC. TC can be used by any monitor. If
you want 640x400TC then you need a monitor than can Handle RGB freq. as
well. Or you can purchase Speed Res Card, and run 640x480TC in VGA mode.

I only use the RGB mode for demos and video work. Otherwise I am in VGA
mode.

The montior above can handle VGA and several Blow-up/screenblaster
modes. But it will not handle RGB. RGB is more like a TV signal. It uses
15Khz Horizontal. Most new monitors don't handle this mode becuase the PC
does not handle this mode. (what a reason!) If you want both you will
have to find an older monitor. Like the NEC-3D or the NEC-Mulisync II, II+,
IIa... or any monitor that can handle 15khz Horizontal.

Hope this helps.

Vince

Hi !

Does anyone knows how to save time after turning
computer off ?
I've haded instructions how to do this through
the ROM modul port (but the electronic
components - especially CMOS MSM5832 has not
been abled to me (MSM5832 is a clock chip)...
If someone wants , i may send him this instructions
in a file (actually in a picture file) ..
So what's bothering me ?
I know You all have TT's , Falcon's, Mega STE's ,
but i have only an old STfm (with only one MB - sigh)
with hard disc and modem ..
I'll be very grateful if someone could tell me or
explain me how could i do this 'time saving' ?
Or, at least, give me some hints about that ...

Gratefully,

Neven

I read in AEO that it's possible to get 640x480 NI in SVGA mode if you put
a Speed Resolution Card inside of your Falcon :-). A slovenian guy wrote this
and I believe that he's reachable over the net. Check the latest AEO!

: / \\ \\ * If at first you don't succeed, call it DOS 6.2 *

I have 544x416 on my NEC 5fgP. This syncs down to 26 khz and in the low
color modes, 1024x768 in 256 colors at 57hz. This is the best I have seen
on any new monitor that doesnt sync to 15.7Khz. Then again this cost
$1100, so it had better be good :). Get a speed resolution card to get at
least 640x480 in TC, from Hard & Soft in Germany.

Of course by using Blowup the 16 color modes can be pushed real high.

Paul

You're probably using the gemdos Cconws() call to print strings. Try
writing your own string printing routine which calls the bios for each
character. Off the top of my head I don't remember exactly which bios
call ignores ^C, (Bconout() ?) but any good manual on the ST should
point you to the correct one.

Of course, if you were using MiNT, you could just trap the signal :)

Cheers, Steve

6147. The architecture of MultiTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-16 18:28:56 UTC
From: gerrymon@Glue.umd.edu
Message-ID: <3adj18$9tr@delta.eng.umd.edu>
Source record: 29033

Does anyone know how MultiTOS works? Here's how I understand things to work (please correct me if I'm wrong since I have a strong feeling that I am):

In regular TOS, the GEM AES provides cooperative multitasking of 1 GEM application and 6 desk accessories. In other words, the GEM AES contains a cooperative multitasking kernal which multitasks GEM processes.

In Mint, you have a preemptive multitasking kernal. But this only multitasks TOS processes. The GEM AES is considered a TOS process and is run preemptively with other TOS processes. So, basically you have two schedulers: The lowest level you have a preemptive scheduler which multitasks TOS processes (including the GEM AES) and at the higher level you have the GEM AES which cooperatively multitasks GEM processes (consisting of 1 GEM program and up to 6 desk accessories).

With MultiTOS you have the preemptive multitasking of TOS processes with Mint but, in addition the GEM AES can now cooperatively multitask multiple GEM programs along with desk accessories.

Is my understanding correct? Does this mean that GEM programs are still cooperatively multitasked in MultiTOS?

It is theoretically possible to make a 4Gb minixpartition. However,
there were a few patches to minixfs 0.6PL10 that recently dropped into
the mint mailing list. You should be able to minit it though. Have you
tried to increase the stack size of minit.ttp ?
(printstk minit.ttp to see the current stacksize, then ie.
"fixstk 64k minit.ttp" to give it a 64k stack)

To get screen output which can't be interrupted by <ctrl> C you should
use Bconout(2,c), or Bconout(5,c) if you want to output characters like
CR, LF and ESC as little graphics squiggles instead of treating them
as control characters. The only way I can think of to trap <ctrl> C in
your own program (if you are not using MiNT) is to check for it yourself
each time round your loop, something like:

```
#define CTRL_C 0x002E0003L

list_directory()
{
register char *p;

while (more_files) { // work through the files
p=filename;
while (*p) { // print the filename
Bconout(2,*p);
p++;
}
Bconout(2,13); // new line
```

```
Bconout(2,10);

while (Bconstat(2)) { // while some keys have been pressed
if (Bconin(2)==CTRL_C)
return;
}
}
}
```

Yes, you're exactly right here.

>With MultiTOS you have the preemptive multitasking of TOS processes
>with Mint but, in addition the GEM AES can now cooperatively
>multitask multiple GEM programs along with desk accessories.

Not quite... with MultiTOS, GEM AES programs (and desk accessories)
become full-fledged MiNT processes, and so are multitasked pre-emptively
(just like TOS processes). The AES itself, and the screen manager,
run as separate sever processes which clients send requests to.

6153. Poolfix for 1.4 ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-16 21:49:59 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <11161994.214959@empyr.dircon.co.uk>

Hi, Can anyone tell me what the 'Poofix' patch actually *does* in TOS 1.4 ?
More to the point, will TOS 1.4 work fine without it ?

I'm running 1.4 with poolfix (because everyone says you should), but my
friend is upgrading to 1.4 and he doesn't have a HD like me, so running
poolfix from a floppy *every time* he boots is going to be a pain
in the *%&!, possibly enough to put him off upgrading. (He uses TOS 1.0
at the moment, and for all of you who've never had the pleasure........
it's like someone came along and stole 8 of your 16 bits !).

In case it makes any difference, he has 2.5Mb of RAM (Marpet Upgrade),
a 1986 Rev C 1040STF, and mostly runs Cubase & other midi intensive stuff.

Any helpers ?

6154. Atari Lynx 16-bit color portable for sale!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-16 22:17:16 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.844.2ECA84EC@getty.onu.edu>
Source record: 29052

I have a complete system. It is an Atari Lynx, 16-bit portable gaming system. It has a color LCD screen, with an electroluminescent backlit screen, so you can play it in the dark, wherever you go. It works with 6 AA batteries, or you can run it off of a 9v ac adapter.
This system has stereo sound. It is also a 16-BIT system, not 8-bit like the Sega Game Gear. I guess you could say that it is like having a portable Genesis with a screen. There are over 70 games available for the Lynx, and more coming out. You will find favorites like Ms. Pac-Man, Joust, Quixx, Ninja Gaiden, Lemmings, and a lot of others I can't remember offhand. There are some new ones as well, like Desert Strike, from Electronic Arts. Most of these games are available for around $20 each, from Atari or other mail order places. I will give the related phone #'s to whoever buys the system. In case you are wondering why I am only selling one game with the system, it is because I now have two! (I will need the rest of the games for my Lynx II) Oh, I almost forgot - the Lynx is the only portable game system that is designed to work with either left or right handed individuals. It has a double set of controllers, and with a push of a button the screen flips upside down (or rightside up, depending on your point of view) and you can enjoy playing left handed with the 2nd set of buttons. This isn't all that important to those of use who are right-handed, but I just thought I'd let you know.

Keep in mind that a Sega Game Gear, which has a smaller screen, (and is only 8-bit) costs $89 without a game, and $119 with a game. I would like to sell this system for the highest bid I get in the next 10 days. If I get a really good bid within the next few days, I may simply end the sale right then & there, because I don't really like auctions much myself. I would also consider trading the system for about 4 OEM CD games, but you would probably have to be a dealer or at least have access to a good selection to be able to get the ones I want. If interested, e-mail me.

I am including:

The Atari Lynx 16-bit base unit
6 new alkaline batteries (batteries included, wow!)
ac wall adapter, to use when you are near a wall outlet
and a free game of your choice!
(pick one from the following list)

Gates of Zendocon (shooter) This game has over 50 different levels! You can get power ups, have side shooters, etc. My favorite is the flying eyeball that shoots fire!

Rampage (the classic "monsters smash up the city" game) This has the original 3 monsters, plus another mystery monster you can play!

Gauntlet III (explore the dungeons, get the keys, fight hordes of ghosts, giant scorpions, the undead, etc.) This one lets you be the wizard, warrior, valkyrie, punk rocker, nerd, cowboy, pirate, and several others. Each has different attributes.

Hi !

I've readed (in some ST magasine) that new PC software
emulator is released (as public domain).
Does someone knows something about it ?

Thanx

6159. Things that go "poof!" (Megafile 44)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-17 05:41:35 UTC
From: ypelletier@cid.aes.doe.ca
Message-ID: <CzED5C.1nG@cid.aes.doe.ca>
Source record: 29120

I own a Megafile 44 (Atari's box for a Syquest cartridge drive).
As various people have mentionned in this newsgroup already, there is
a berth and connectors for a fixed HDD alongside the Syquest. So...
the plan was: when I'd get a larger drive to replace the stock
internal HDD in my TT, I would put the old drive in the Megafile 44
housing, so as not to lose a single ounce of storage.

Well, that day came yesterday. I removed my old hard drive (a 52 Mb
Seagate drive that came with my TT) and replaced it with a new 340 Mb
Conner. That was the easy part.

Then, I installed the old Seagate drive in the Megafile 44, using the
second 50-pin connector on the host adaptor board, and the second
power supply connector. I flicked DIP switch #1 (on the underside of
the plastic casing) to enable the second drive. So far, so good. I
closed up,
re-attached the drive to the ACSI port of the TT, and powered up.
The
hard disk driver (AHDI 6.05c) readily recognized both the Syquest and
the Seagate. I could read from the Seagate; it all looked perfect. I
was quite proud of myself :).

But I soon had a nasty surprise: about 20 minutes after I powered up
the Megafile 44, there was a loud "pop", smoke, and the Megafile fell
silent. The power supply was blown, but good: I found pieces of an
exploded capacitor inside the housing during the post-mortem.

So now the obvious question is: what went wrong? I am hoping that the
collective wisdom of the Net would help me choose between the
following
alternatives (or maybe suggest new ones):

1. maybe I had a defective power supply. The defect might not have
shown up as long as there was only one drive drawing juice, but
perhaps it could not handle the second one. This theory is supported
by the fact that it is a component of the power supply that blew, as
opposed to a fuse.

2. maybe there is something wrong with the Seagate drive. But how
could a hard drive draw enough power to blow a power supply rated at
81 Watts??? Besides, the Seagate was not unusually hot after the
incident.

3. maybe the failure was due to an error during installation. Did I
need to do something about termination of the SCSI chain? And if so,
would that be enough to cause the power supply to blow???

Right now I'm leaning toward explanation #1. But before I install another power supply in there, I want to make sure that the hardware whizzes out there agree with me.

All advice will be gratefully received.

Regards

Yves

I got it compiling under Lattice 5.6 after a little fiddling. Most
fixes were obvious ISO C errors, but the one major change I made was
#include'ing <mintbind.h> instead of <osbind.h> in "mint.h".

Poolfix must be used with TOS 1.4, Codehead has a moded version
of PoolFix4, they state that this is the only one to use as
PoolFix92 has more bugs than fixes...

PoolFix4 was done by Claus Brod, I don't have all the facts here on the
CodeHead mod....

May be Claus Brod could clear this up for us....

Try renaming the file profile - this is the usual name for
the file if it resides in /etc. If you can set the environment
variables prior to running bash (in mint.cnf or use environ.prg)
then set the environment variable HOME and but bash.rc in there.

Of course you could always use tcsh instead - the last time I
tried bash on the atari I had problems within when I ran shell
scripts.

The Unix version of bash calls the config files .bashrc and
.bash_profile - You could have a version of bash that uses
that scheme. If so then you should probably be using a
minix filesystem!

Not neccessarily correct. It all depends on how read() has been
implemented in the compiler libraries - there are some
implementation that whenever they see ^C and isatty() is true
call exit() - Cconws is never called. This feature is totally
compiler generated. I remember having to fix that nonesense
in the LaserC libraries.

> (printstk minit.ttp to see the current stacksize, then ie.
> "fixstk 64k minit.ttp" to give it a 64k stack)

Unfortunately I must have missed those patches but thanks to a friendly
soul here on the net (hi Steven!) I have a patched up version anyway.
However I still have problems minit-ing a 1GB partition. It could have
something to do with me using MiNT v1.11h3 compiled with GCC v2.5.8, so
I'll try it out again later today when I have installed MiNT v1.12.

Also, I did try with a stacksize of 128k, but it still ended up with
a bus-error or illegal instruction error.

Thanks anyway.

6168. HELP! Stacy Serial Port Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-17 13:39:31 UTC
From: jperez@uhunix3.uhcc.Hawaii.Edu
Message-ID: <CzEz9v.AMv@news.Hawaii.Edu>
Source record: 29111

I have a Stacy with 4meg and a Quantum 540meg HD, attached to a Zoom 14,400 faxmodem. The machine is otherwise unmodified, and is running TOS 1.4.
For some reason, it is unwilling to communicate with the modem at any speed above 2400 baud (although the modem appears to connect at 14,400). Essentially, I can see that the modem is recieving data (the lights flicker); yet, it fails to respond to any commands sent at faster than 2400. This is most peculiar since I am certain that I have used this modem with Stacy before at high speeds, and the modem still works fine if I plug it into my Mega STE (which I just sold to make way for a Falcon).

Any ideas as to what could be causing the difficulties? I have tried: * Several of the serial port patches such as Serial fix, TurboCTS, and HSmodem4
* Booting from floppy rather than hard disk
* Straight Fax 2
* Bare software installation (no accs or auto programs)
* ST diagnostic serial loop plug test (appears fully functional)

I am totally out of ideas on this one... Please send E-mail.

That should not be a problem, i just did the similar thing with a pc keyboard and a macintosh. I used a little microcontroller (8031) to do the key translation. It should be quite simple to use the 8031s SIO to connect it to an ST and i still have one interrupt line and some io pins free to sample the STs mouse, perhaps someone wants to try this?

>WWW access is at http://micros.hensa.ac.uk/

Great news! One thing concerns me though. The readme.src file states
that "gcc 2.5.x causes problems..."

Now I'm aware of problems with 68000 code generation up to 2.5.7, but
2.5.8 is _supposed_ to be ok in this respect. Indeed, I compiled
MiNT1.11h2 (no MultiTOS) using 2.5.8 and have found it to be very
stable. So what's the deal?

Cheers,
Steve "wishing he'd subscribed to the MiNT-list sooner" Woodford

Rick you don't need that info for SCSI drives, the software
get that info from the drive

Older MFM/RLL drive do need the drive specs...

If the ICD software (now version 6.5.5) can talk to the drive
it should get that info...

Some drives that are set up for Mac use do need changes to work
with a Atari host adapter...........

Very very normal with a old power supply, these caps get hot and dry out, some
times they go pop..!!!...

Just replace all those Electro Caps with new ones, if you can get ones
rated for 105c, insted of the 85c....

6181. GhostLink backwards?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-18 06:04:00 UTC
From: migva@tyrell.tynet.sub.org
Message-ID: <5a4MLCRgwiB@migmail.tynet.sub.org>
Source record: 29023

Hello, I got Ghostlink and am really happy with the way it works
with my PC. I was wondering if there was and STslave.prg program instead
of the PCslave.exe file. Is there an ST emulator for the PC? (I doubt it
because of the two different CPUs but oh well.) Thanks for your help.
Miguel

6182. Help needed for a flowcharting program

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-18 06:15:56 UTC
From: leslieh@warpcon.ersys.edmonton.ab.ca
Message-ID: <EKSGBCUQUp@warpcon.ersys.edmonton.ab.ca>
Source record: 28999

Please send email to leslieh@warpcon.ersys.edmonton.ab.ca
regarding this message. It seems to be a particularly heinous
problem that needs to be solved. Thank you for any help rendered.

I'm building a flowcharting program using an object tree as a page
of the flowchart. The symbols are icons with children that are strings.
The lines are user-defined objects with no children. The parameter passed
to the routine to handle the user-defined object consists of a list of
objects to connect.

The first object is the orgin object. The rest of the list
contains the objects the first object is connected to. It also contains a
string that is the label for some of the lines (such as labeling a yes and
no branch in a decision).

The things that I need to know are:

- How to insert an object or objects into an object tree,
maintaining the rules for a GEM object tree (such as the
root object has to be the size of all the children,etc).
- The best way to delete an object in a tree.
- How to print an object tree keeping it compatible with
the majority of Ataris.
- How to save an object tree so that rsrc_load can
understand that it is a tree.
- Perhaps some fast drawing routines for symbols instead
of using icons for symbol representation.

Thanks in advance for anything you can give me,

Blaine Brysh

Once again, thank you for any help you can give.

6183. Falcon + FPU problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-18 07:40:06 UTC
From: der@discovery
Message-ID: <DER.94Nov18084007@discovery>
Source record: 29140

HELP!!!

Ever since I received my Falcon last week I've had problems with system hang-ups (mainly while running MiNT). After having ruled out every possible software-related bug I started at the hardware.

When examining the FPU (MC68882FN33A, yes I did order a 33MHz-version since I will install SpeedRezCard ASAP) I noticed that 4 pins had been demolished and probably didn't have proper contact with the socket. I pulled the chip out and VOILA, the Falcon worked as it should.

After having performed some micro-mechanical work on the chip trying to recreate the original shape of the 4 demolished pins, I inserted the chip. To my surprise the problems reappeared. I might point out that I have no way of testing if I really have contact, but through a lupe everything looks just fine.

When running GEM Bench it reports that a LineF FPU is installed but that floating point math speed is only 14 percent of what it should be (which is the same figure you get without a FPU).

What is going on within my Falcon? Should I suspect bad contact, or is it the chip that fails on me? Running a 33MHz chip at 16MHz shouldn't be a problem, or?

Since the guy that installed the chip obviously didn't know what he was doing, is there something else apart from putting the chip in the socket that needs to be done in order to make it work (like adding a GAL on the MSTE)?

I think the problem may be that NEO files are 320*200*16 colour and same
goes for PI1. The toolkit imageload routines work fine if you use them
correctly (I have only tried colour IMGs).

No the AES in multitos supports preemptive multitasking of GEM applications
and accessories. All GEM apps are considered separate processes by the MiNT
scheduler, even accessories which under normal TOS are counted as part of the
main app.

>I don't have too much experience in this, so I need all the info
>I can get.

14k4 bps is the slowest I would suggest you buy now, although second hand if
you can get a 9600 cheaply that might be worthwhile depending on how heavily
you will use it.

You want v42 error correction and v42bis compression; for simply sending
zipped files which is what I use my modem for they have little effect but if
you intend to use it as terminal the extra speed will be useful.

I don't know whether you want fax, but if so make sure you get class 2 as not
much software supports the older class 1 standard. The Supra 144LC is class 1
but most other new ones will be class 2 including the Suprafac v32bis.

>Also, recommendations for software.

If it's just terminal software you want, Connect is my favourite, although
it's best on a fast machine as it uses GEM. A nice non-GEM (and therefore
fast) one is Teddy-term.

>I'm going to connect up to a UNIX host, and use an offline reader if possible.
>Also, several windows (for UNIX multitasking) would be nice, so
>I could for example read mail, "talk", and have the command line
>at the same time. Is it possible?

Not really, not without writing your own software both for the atari and for
the unix system. What you really want to do is get an X server (is there sucha
thing for the atari?) which would let you multitask, and run graphical apps as
well.

For those who pay for newsfeeds, the excessive text was more of a problem
than the blank lines. Emily says:

: Q: Dear Miss Postnews: How long should my signature be? -- verbose@noisy
:
: A: Dear Verbose: Please try and make your signature as long as you
: can. It's much more important than your article, of course, so try
: to have more lines of signature than actual text.
:
: Try to include a large graphic made of ASCII characters, plus lots of
: cute quotes and slogans. People will never tire of reading these
: pearls of wisdom again and again, and you will soon become personally
: associated with the joy each reader feels at seeing yet another
: delightful repeat of your signature.
:
: Be sure as well to include a complete map of Usenet with each
: signature, to show how anybody can get mail to you from any site in
: the world. Be sure to include Internet gateways as well. Also tell
: people on your own site how to mail to you. Give independent
: addresses for Internet, UUCP, and BITNET, even if they're all the
: same.
:
: Aside from your reply address, include your full name, company and
: organization. It's just common courtesy -- after all, in some
: newsreaders people have to type an *entire* keystroke to go back to
: the top of your article to see this information in the header.
:
: By all means include your phone number and street address in every
: single article. People are always responding to Usenet articles with
: phone calls and letters. It would be silly to go to the extra trouble
: of including this information only in articles that need a response by
: conventional channels!

Actually, I think you'll find that ACC's aren't considored seperate processes,
although actual GEM applications are. Try ctl+alt+tab to cycle current app.
You'll cycle though all applications, and the desktop - but not the accs, even
if they are open. Also, they don't appear in the list of current processes
if you bring up the Process CPX.

The other acc problem (or feature depending on how you view it) is that
memory allocated by an acc still belongs to the GEM app running at the
time it allocated it. I believe that accs are considered part of the
GEM process by the MiNT kernal, and multitasking between them is done by
the AES, not by MiNT.

Craig.

Wow. I'm impressed. I really like the way MultiTOS is organized. It
sounds like a really elegant design. Very clean...

I would love to see someone write an operating systems textbook using
MultiTOS as one of its design cases. Reading about some of the
design decisions would be interesting. I'm sure there were some
tricky issues involved in moving TOS to a pre-emptive multitasking
environment.

By the way, I've always been curious as to why MultiTOS (and MiNT)
supports memory protection but not virtual memory. Once you have
memory protection, isn't it somewhat easy to implement virtual memory?

Rod, thrid party devices from Titan, Overscan and/or JRI. you can also
attach PC VGA external genlocks to the Falcon's VGA port. Works just as well :)

Cheers

I'm slowly (very slowly) translating the .hyp into english. Partly by
translating the hyp and partly (when things get tough) by reading the source.
Assuming Christian has no objections I'll make it available RSN.

Cheers,
Simon

Hi,

my girlfriend's son's PC has lost its extended CMOS-RAM settings and we have
lost the setup program.

Anyone who can help ?

All hints (and setup programs) appreciated.

Kind regards, Volkmar

Volkmar Gross, Alexanderstr.18, Bremen, Germany (Fone&Phax: +49 421 74434)

Nope, not me.
When I compiled gcc-2.5.8 I compiled the objective-c compiler as well
as the GNU objc library. Never used it though - could somebody
recommend a good book for learning objc. I know C and C++, but nothing
about objective c (except that it is popular on the NeXT cube).

>stable. So what's the deal?

There appears to be a problem compiling proc.c with gcc 2.5.8, independent of the processor type (i.e., bug exists for both 68000 and 68030 code). We haven't got too many details on the exact problem just yet. The problem also seems to only manifest when running AES 4.1 (MultiTOS). Needless to say, we're pretty eager to find what the problem is... Since it appears with both the 68000 and the 68020 code generation, it's likely to be a bug generic to GCC's m68k support, and therefore may still be present in 2.6.0 and 2.6.1, though I don't know for sure. (Haven't looked at any recent GCC ChangeLogs to see what's been fixed...)

From: lunman@ChamplainCollege.QC.CA
Message-ID: <3aju91$8ge@samuel.ChamplainCollege.QC.CA>
Source record: 29017

Well, I know that ^S and ^Q will pause and resume the listing. What I want to do is abort the listing and return to the prompt.

Unfortunately, I'm not running under MiNT mainly because I'm very unaware of what MiNT is, where to get it, and I'm quite used to my regular TOS 1.4 setup.

I'm curious though, is there ANY POSSIBLE CHANCE that the signal library from MiNTlibs would work under TOS 1.4? It seems to me that there must be SOME way to intercept this. Perhaps a low-level embedded assembler routine or something? (Just a thought...)

>in the background.

No, this is not correct. The MultiTOS AES doesn't do any scheduling.
The MultiTOS AES is just an AES that understands multiple processes.
You can run multiple GEM apps pre-emptively under MiNT, but it will
crash very quickly :-) The reason why MultiTOS runs so slow is that
GEm normally polls the mouse and keyboard during evnt_multi() when no
other apps are running. Now, since MultiTOS is pre-emptive, it has
to poll constantly since multiple apps can run at the same time, so
even if one app is processing, and never calls evnt_multi(), the other
apps can still run, update windows, send messages, etc. The polling
will be taken care of soon, from what I've heard using MiNT devices.

Its fully pre-emptive!

Indeed, I have scheduled tomorrow (Sunday) for produces any necessary patches
for compiling 1.12 with Lattice. As Eric incorporated my 1.11 patches, it
should be fairly easy.

If people put prototypes in their code, it would be even easier.

Date: 11/19/94 Time:16:56:00 EST

Brian, I just picked up a message from you concerning someone here in the
Usenet wanting the source for FoRem, as far as I know the code reverted
back to Bill Turner in Conn. after him and the sysop at Mile High had
problems, I'm interested in who ever is wanting to get the code and make
it falcon comp. I tried running it on a 030 but there are problems in
forems modem routines that won't let bink shell from Modem2 to modem1
within the routine hard coded into Forem, also there were severe problems
running the Forem Mailer, I licked the first problem, but when it came
time to run the mailer it would work up to a point of dialing a node but
it would not see the carrier come back to it. It definitly was one of the
most powerful bbs packages I've seen. Let me know if you find out who is
looking. I would like to talk to that person.
P.S. Try Bill Scull, you can reach him at 51:1/0 @Atarinet....

I have the US Robotics Sportster 14.4. This is available at a good price
at present, round about 150 pounds. There are some cheaper modems, but this
is good and widely used.

I subscribe to Cix, which has good information and an Internet gateway.
What I/m doing with mail at present - I *think* it saves time is the
following clunky method. Log in to my Uniz host, save mail to a file,
logoff. Then use Cix (ftp from the Unix host to Cix, and download from Cix
to my home machine) to get this mail file on my own machine to read it at
leisure.

GEMBench simply uses the cookie jar to check for the FPU as far as the
display goes. When actually executing the test code it uses the Lattice C
built-in auto detector.

>Very very normal with a old power supply, these caps get hot and dry out, some
>times they go pop..!!!...

But, as usual, you fail to pay attention to what's going on.

Yves, the PSU in the megafile isn't rated to 85W, that's the total
worst-case power disspiation of the whole unit. Given the (in)efficiency
of those power supplies, it implies that it might be good for about 40W
or so, depending on the current draw for each rail. Syquests are pretty
power-hungry, and the ST251 in the TT isn't a lot better.

Basically, the power supply in the megafile isn't up to handling those
two drives. You may be able to hack it to deal with them, or you can
go looking for a better power supply, or if the new drive is lighter
on the juice, put it in there and leave the 251 in the TT.

>Just replace all those Electro Caps with new ones, if you can get ones
>rated for 105c, insted of the 85c....

Indeed - rebuilding the old supply with larger caps is a good way to
up its capacity by 15-30% without too much trouble.

This means that TOS detects my FPU and adds it to the cookie-jar, but
the auto-detect code in Lattice does not detect it. Strange!

Does anyone know if my FPU-problems could come from the fact that I've
got a 33Mhz chip running at 16Mhz?

It's freeware, and by far the best libary for window-dials, flying-dials and related stuff. Comes as source only, compilable by GNU-C, Lattice-C and Pure-C. Available from various ftp-sites. I think Hensa has a copy by now, and I got my copy from some German ftp-site (tu-berlin?). Just look around or do an 'archie' for EGEM.

6222. MiNT 1.12 Problems!!! (was That darn '^C'...)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-20 14:11:08 UTC
From: lunman@ChamplainCollege.QC.CA
Message-ID: <3anlds$7sa@samuel.ChamplainCollege.QC.CA>
Source record: 29037

Well, since everyone on this newsgroup keeps raving about MiNT, I decided to try it out for myself. So I downloaded MiNT v1.12 from umich.edu, I installed it, read the documentation, etc... I can see why it's so popular. It seems quite powerful.

BUT... Now, it seems that any program created under HSC doesn't work properly! Mainly, the text screen operations are all confused. I get inversed text out of nowhere, the text prints - NOT where the cursor is - but just a bit further to the right!!! MiNT seems to cause some weird confusion with the text screen.

I just can't figure out why it would do that! Any other GEM program works just fine.

Has anyone had this problem, or something similar? Is there a patch available? Would an older version of MiNT perhaps not cause this confusion? (So many questions, so little time...)

I tried changing a few parameters in the MINT.CFG but it had no effect.

Seems like an awful lot of trouble just to intercept ^C, no? 8-}

I have noticed over the last few months that running certain programs causes the screen ti get corrupted. Ie all the colours of the background, windows and icons change. Sometimes it gets so bad you cannot read what is on the dialog buttons.

Is their anyway round this?

My system is Falcon (TOS 4.01, MiNT 1.12) with 4mb ram, FPU and internal HD.

: DSP 16.
: Total about 20.

: MIPS are a really pathetic speed measure though - very biased towards RISC.

I doubt the system actually runs at 20 MIPS though, as most software fails
to make use of the DSP and CPU at the same time. Sure some stuff is fast
displaying JPGs with the DSP decoder takes a matter of seconds, but
very little software makes use of it.

I was thinking the other day, why not write (or port) a WP to use DSP
as well. For example the DSP could handle the import/export of graphics
(in full colour e.g JPG etc). It could also handle the screen re-draws and
spell checking in the program. This would speed things up no end.

In <CzFF9K.KJL@eskimo.com>, Steve Woodford writes:
>Great news! One thing concerns me though. The readme.src file states
>that "gcc 2.5.x causes problems..."

It looks like gcc 2.5.8 (2.5.x, x<8 wouldn't work at all on 68000)
messes up slightly on _one_ source file in the MiNT distribution, which
makes MiNT not work properly with the MultiTOS AES. That appears to be
the only problem.

>Now I'm aware of problems with 68000 code generation up to 2.5.7, but
>2.5.8 is _supposed_ to be ok in this respect. Indeed, I compiled
>MiNT1.11h2 (no MultiTOS) using 2.5.8 and have found it to be very
>stable. So what's the deal?

It looks like a bogus optimization; that reminds me, I'm supposed to
send some code to Howard so he can go over it with a fine-toothed
diff...

Hey, you can play DOOM on a Jaguar with _better_ texture mapping (65k
colours vs the 256 colours most PC games use) for just a bit more than
the price of a good PC keyboard!

Not that far-fetched, but it's true!

IMPORTANT NOTICE!!!!!!! IMPORTANT NOTICE!!!!!! READ THIS!!!!!!!!
------------------------------------------------------------------
```

As I will lose free Internet access soon (in about a month's time) and will no longer be able to search and test endlessly all FTP sites any more, like I have done so far, I will now hand this list over to Mark Smith in the UK, so that it can be further updated and posted. I might be back on the net later, and take over again (or do it in co-operation with Mark), but as of now Mark Smith (msh@dl.ac.uk) will handle everything concerning this list. So, write to him if you have any updates or new sites etc, and not me.
See ya!

Hallvard, Oslo, Norway

PS. Thanks to all for your encouragement and support!!
Good luck Mark!

PS!!! 155.198.1.40 is more reliable!!! - (uni-paderborn, GERMANY)

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
--------------------------------
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
```

7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

- - - - - - - - - - - - - - - - - - - -

: Effect : My CLI quits COMPLETELY, and returns to GEM!
: How can I fix this? Can I disable the ^C handler? Can I reroute it to a
: function within my program (Like in Borland C++)?

The usual way to avoid this problem under plain TOS is to use BIOS calls for input and output instead of their GEMDOS equivalents. This trick is used by many shells, for instance Gulam. But there is another possibility, which consists in trapping the 0x408 vector (etv_term). Indeed, when you press ^C, this vector will be called with -32 on the stack; this usually causes the program to terminate with exitcode -32, but you could program etv_term so that it leads you back to some point of your code, using setjmp() and longjmp(). It seems that some debuggers used this technique... Obviously, it's extremely dirty; under MiNT, you'd only need to catch the SIGINT signal.

Thierry.

> Eh, I thought everyone knew that a blown fuse would make any equipment
> useless... ;-)
> (and his machine is still useable...)

You have obviously never encountered a "flaky" fuse. On several occasions,
I have found fuses that still passed current, but not reliably (on/off, or
acting as a resistor). Also, the points at which the fuse screws/clips into
the device can accumulate corrosion. In the case of clips, if the fuse has
ever been replaced or dinked with, the clips might not have enough tension to
make good contact with the fuse, which often causes a carbon spot. Thus,
when I am trying to fix a fused device, I pop the fuse out, check it with a
multimeter, and clean/adjust the contacts before putting it back in. If it
looks even a little bit funny, I just replace it.

Boy, so this is the thanks I get for giving away one of my voodoo repair
secrets :-). Just for that, I won't describe my Fonz-style monitor whacking
technique.

> I doubt the system actually runs at 20 MIPS though, as most software
> fails to make use of the DSP and CPU at the same time. Sure some stuff

I think is one of the biggest failings of the Falcon. It lacks raw 'guts'. Sure the DSP is a very powerful chip, but not immeadiately useful to many types of program. The TT was a much better design IMO, at least as CPU power went.

Had the Falcon been a cheap TT with a DSP, then things might be very different.

Roland.

Well so fare only one reply to this request....

FSEARCH 7.4, where does one file this Program...??

I need a file search util that will find all files say with the string
dog in them, like medog.prg or dogme.prg...

With just entering the name dog and it will search all partitions
or selected partitions, must be fast and not a ACC or TTP....

Is their such a thing, I have used such a thing on a Atari BBS..!!

Which programs? I may have encountered one program that, since
it used up 256 colours and didn't seem to restore the palette,
uglified the screen, icons, and dialogs. NeoDesk 4 seems to as
well, but thankfully includes a keyboard shortcut to restore the
color palette. (All those 256 color .BMP backgrounds!)

I'm having a go at it myself with the old Falc. I'm anxiously awaiting
the new release also.....does anyone know when pl4 is going to come out?

In any case, it's entertaining to boot the kernel and see UNIX on an Atari
but until we can actually use HDs reliably I'm afraid it's not very
useful! It'd be nice to have more than 3.95 BogoMIPS too!

Take it easy.

Actually bezier curves have been in NVDI since version 2.11 ish, which
is pre-Speedo. FontGDOS was the first GDOS to have bezier curves.

Source record: 29055

Last weekend I needed to use my SFTM's serial port for the first time in years, but I got no output. Receiving was o.k though.

After checking the cable setup, I moved on to the drivers & found that there was no + 12 /-12 output from the TL497A which provides power for the drivers.

As my STFM is now tower cased, I took the lazy option & jumpered supplies from the tower PSU, cut two traces & got it working.

I've never seen reports of this device failing, is this usual?

On my motherboard, there seems to be a lot of modification done around this circuit, there are a few mid air connections & extra components.
Was there a design problem with this in early STFM's?

Well I managed to find FSEARCH 7.4, I could not get it to do
what I wanted, but I found it far to slow, one of the slowest..

Also it looks like inteded for Mono use as I could
not read some of the dialog text....

I dnloaded 8 Find/Search utils from GEnie, one that looks
ok is Jet Find, its fast and worked they way I thought
it should, problem is the Doc's are in German but the program
is in English...

Are thier any otheres...??

6239. Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-21 10:26:00 UTC
From: christian.dahl@p4.f611.n203.z2.ct.se
Message-ID: <09ee6806@ct.se>
Source record: 28957

Well, I ask again (due to some mailingproblem):

There is a variable in Mag!X that tells it if the multitasking should be on or off (and if on, priority and timeslice), you can adjust it with a CPX. Now, I wonder how I can find it in a legal way (right now the variable is located at $DF2)?

And another problem (BIG!):

Has anyone managed to have a long timer A interupt (for creating music), and not having trouble with the keyboardinterupt. Note that I have to lower the keyboardinterupt to $2500, so that the timer A interupt is stabile and not "jumping" around. If I dont lower the keyboardinterupt everything works, but I HAVE TO lower it. Right now I have a piece of code looking like this:

```
keyboard:
move.w #$2700,sr ; Not neccecery but it wont hurt
bclr.b #6,$fffffa15.w ; Makes sure that no other
keyboardinterupt occurs during a keyboardinterupt. This has to be done, else
there is a possibility that another keyboardinterupt occurs before the first
one is handled.
move.b #%10111111,$fffffa11.w ; Release interupt, makes it
possible for a new MFPinterupt to occur
pea return
move.w sr,-(sp) ; Make sure that we returns to our interupt
after systemkeyboard interupt
move.w #$2500,sr ; Interupts possible to 68k
oldkeyboard:
jmp $12345678 ; Jump to systemkeyboardinterupt
return: bset.b #6,$fffffa15.w ; Waiting in keyboardinterupts may now occur
rte
```

```
musik_interupt: ; Interupt for Timer A
move.w #$2700,sr
tst.w busy ; Ingen overload!
bne.s nooverload
bclr.b #5,$fffffa0f.w
tst.w MiNT
beq.s ingenMiNTladdad1
bclr.b #5,$fffffa09.w ; L�s timer C
ingenMiNTladdad1:
move.w #1,busy
movem.l d0-d7/a0-a6,-(sp)
tst.w MagX
beq.s inteladdatMagX1
```

```
move.l $df2.w,pausMagX ; Quick and dirty pause the
move.l #-1,$df2.w ; Mag!X taskcontroller!
inteladdatMagX1:
move.b $ffff8a3c.w,blitter ; Blitterstatus
clr.b $ffff8a3c.w ; Pausa blittern ifall den arbetar
tst.w colorbars
beq.s intevisaf�rger1
sub.w #$111,$ffff8240.w
move.w #$EEE,$ffff8240.w
intevisaf�rger1:
move.w #$FFF,$ffff8240.w
```

```
Well, up here there is some stuff done, and down here in the
callUMP-routine we have this two lines among others:
move.w #$2300,sr
move.b #%11011111,$fffffa0f.w
This two lines make it possible for a new interupt to occur on the 68k from the
MFP. And it does occur in my own timer A routine, but STILL the keyboard messes
up (trashes under normal TOS, under Mag!X the cursor jumps around)! Whats
wrong?

bsr callUMP ; Skapa musiken

CD
```

: I think is one of the biggest failings of the Falcon. It lacks raw 'guts'.
: Sure the DSP is a very powerful chip, but not immeadiately useful to many
: types of program. The TT was a much better design IMO, at least as CPU
: power went.

: Had the Falcon been a cheap TT with a DSP, then things might be very
: different.

You have to balance the situation off, the Falcon is/was a consumer
machine, ie nice graphics sound and the inclusion of DSP and SCSI make
it a powerful competitor to the likes of mid-range PCs and Amigas. If
developer made use of the DSP to handle certain tasks in applications
either by coding it themselves or allowing the inclusion of additional
drivers (e.g brainstorm JPG) then we'd see a HUGE jump in the quality
of Falcon APPS. Especially in the case of the later where the developer
would be able to avoid actually having to do the stuff himself.

To be honest a Falcon with a medium set up like mine (e.g 4mb RAM,
65MB HD and FPU) is easily as fast as any 486 PC I have used so far.
Whats more if you use MiNT 1.12 (which I installed the other day)
as opposed to 1.04 then you get a very nice truely pre-emptive OS.

It's only the libraries that need updating. As xbios routines are mostly
implemented as macros or inlines they can be added just by editing the header
file.

From: mu@pax.eunet.ch
Message-ID: <CzMBH1.6A2@eunet.ch>
Source record: 29068

As I have already had three times the power supply broken on different ST's which costs about 100.- to 150.- SFr. I am asking myself, if there is a possibility to fix this part myself.

My questions are now (manufacturer of the boards is Mitsumi):
- Are there any parts which are known to break?
- There are some Hitachi-parts on the board which I can't buy here. Are there any known replacements for these?

Thanks for any help.

It`s a 64-bit games console from Atari. It`s got some pretty impressive games like Alien VS Predator, TEMPEST 2000, CYBERMORPH etc. etc.

The Jaguar has amazing processing power, definitly the most powerful games-console on the market at the moment.

I've ran into a little problem when reading the .NDX files on QWK packets.
The message offsets are stored in these files in a special format called
Microsoft Basic MKS$. I have compared this to the MKS$ formats of Atari
BASICs, and they don't match...
I'm looking for a way to convert these numbers into numbers I can actually
use.

I'd greatly appreciate any help...

Brian

6253. 2nd CFV: comp.sys.atari.programmer

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-21 16:11:43 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.programmer-CFV2@uunet.uu.net>
Source record: 29074
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

LAST CALL FOR VOTES (of 2)
unmoderated group comp.sys.atari.programmer

Newsgroups line:
comp.sys.atari.programmer Programming on the Atari computer.

Votes must be received by 23:59:59 UTC, 28 November 1994.

After this CFV appears on news.announce.newgroups it will be sent to
the mailing lists lexicor-list, gem-list mailing list, gem-magazine.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Siu <ysiu@lexicor.com>

CHARTER

Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

HOW TO VOTE

Send MAIL to: voting@qualcomm.com
Just Replying should work if you are not reading this on a mailing list.

Your mail message should contain one of the following statements:
I vote YES on comp.sys.atari.programmer
I vote NO on comp.sys.atari.programmer

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

One vote counted per person, no more than one per account. Addresses and votes of all voters will be published in the final voting results list.

: --Johnny

.lzh is used by the lharc file compressor to indicate its compressed format.
You can get an lharc file compressor/decompressor at any good ftp site.

Try atari archive if you are in america; atari.archive.umich.edu in
a directory called Archivers. You should be able to get hold of an
uncompressed version (ie with a .ttp extension) if you do not already have
any file decompressors (zoo,arc,lharc,zip,gzip).

as spake by lunman@ChamplainCollege.QC.CA (Jon Lunman) :
> I'm curious though, is there ANY POSSIBLE CHANCE that the signal library
>from MiNTlibs would work under TOS 1.4?

There's every possible chance. Programs compiled with the MiNTlibs run
just fine under plain TOS; the library code auto-detects the presence or
absence of MiNT and does the right thing.

There used to be a Commercial version for the Atari, the Big problem with this meathod is their is No Data Checking at all, so if you use a Video tape with a small scratch, your data will be lost ...!!!

No I would never trust it.....

I have an A4 flatbed scanner based on the silver-reed personal
photocopier. A number of companies converted these to scanners
and the one I have was by Print Technik.

The problem I have is that the falcon is too fast for the
software. I can get something from scanner if I switch to
8Mz and turn of both the instruction and data caches, but
the output is streaky. This doesn't occur when I use the
scanner on a STFM.

Does any one know how to contact Print Technik? Everything
I've tried has been without success. Do they still exist?

Well I've finally got 2.6.1 up and running. Now the problem
is how to distribute it to a.a.u.e. Any one got any
suggestions? Here at cov.ac.uk we don't have direct ftp
access and hhcp won't recognise none uk sites. I can
guestftp to nsf.sun, using spad however.

The distribution contains 3 zoo files gcc161[abc].zoo would
you believe. And contains gcc, g++, cc1, cc1plus, and cc1obj,
along with the g++ library, the Objcective-C runtime library
and the Objective-C container class library.

>absence of MiNT and does the right thing.

Not in this case I fear. While you can set up signal handlers using
the Mintlibs under TOS and Mint, the only time they will get called
under TOS is when you explicitly call raise() or kill(). Under Mint,
they get called by the OS as well. Both behaviours are ISO C and POSIX
conformant.

Looks like you'd be better off hacking into the etv_term vector when
in TOS!

From: lippo@dasd.honeywell.com
Message-ID: <1994Nov22.075507.1@dasd.honeywell.com>
Source record: 28954

Help!

My STacy keyboard is dying. Some keys have stopped operating and others are intermittent. Using a X30 scope I've found the problem, the flex cable that runs from the keyboard to the main board has stress fractures on a majority of the signal lines and some traces have broken completly.

Questions: Where can I get a replacement keyboard or new mylar flex circuit? How does one repare said damage without making it worse? What good is a STacy w/o a keyboard?

Reply here or to lippo@dasd.honeywell.com

6271. [HELP] Mouse-clicks fall through alerts! What do I do?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-22 15:44:42 UTC
From: jhh@cwi.nl
Message-ID: <jhh.785519082@news.cwi.nl>
Source record: 28941

Hi,

I recently wrote a little event test program, which would wait for an
event and then display it using form_alert. I ran it on my Falcon 4Mb/65Mb.
However, if I, after the first alert appears, click its close button,
I immediately get another alert informing
me of a mouse button event (which is apparently the mouse click I used to
close the previous alert). My question: what happens, and what can I do
about it? Apparently form_alert doesn't remove the mouse button event that
caused it to exit. Is it safe to always add an extra call to evnt_button after
form_alert to catch this spurious mouse event? Or is there a patch somewhere?

Any help would be appreciated; please use Email if possible.

Thanx,

From: A.I.Nicholls@herts.ac.uk
Message-ID: <42332ed21211@m15.herts.ac.uk>
Source record: 29090

With minor modification I got the Enhanced GEM libraries to work (whether it has made the code wrong I don't know) under GNU C 2.5.8.

I made the library e_gem.olb from the make command, but I can't seem to link the test files with the new library.

It just says it can't resolve some of the entries in the library.

I have tried placing the e_gem.H file in the same directory and the standard include directories

With the object library - I placed that also in the LIBRARY directory (with the other GNU C libraries) as well as placing it into the source file directory.

The test file was one given away with Enhanced GEM - hello.c

Can anyone help?

6274. Help needed for this problem

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-23 00:17:50 UTC
From: leslieh@warpcon.ersys.edmonton.ab.ca
Message-ID: <EKXABEUQUp@warpcon.ersys.edmonton.ab.ca>
Source record: 28948

Anyone who can help with this problem will be forever revered.
Thank you.

I'm building a flowcharting program using an object tree as a page
of the flowchart. The symbols are icons with children that are strings.
The lines are user-defined objects with no children. The parameter passed
to the routine to handle the user-defined object consists of a list of
objects to connect.

The first object is the orgin object. The rest of the list
contains the objects the first object is connected to. It also contains a
string that is the label for some of the lines (such as labeling a yes and
no branch in a decision).

The things that I need to know are:

- How to insert an object or objects into an object tree,
maintaining the rules for a GEM object tree (such as the
root object has to be the size of all the children,etc).
- The best way to delete an object in a tree.
- How to print an object tree keeping it compatible with
the majority of Ataris.
- How to save an object tree so that rsrc_load can
understand that it is a tree.
- Perhaps some fast drawing routines for symbols instead
of using icons for symbol representation.

Thanks in advance for anything you can give me,

Blaine Brysh

You could try calling

wind_update(BEG_MCTRL)

before putting up the alert, and

wind_update(END_MCTRL)

afterwards. This usually fixes a similar problem with dialog boxes.

Hmm, I may be a problem of the order of the object files in the lib. You might want to try the -s option of gnu-ar, which lets it make a symbol-table at the beginning of the lib file.

|> I have tried placing the e_gem.H file in the same directory and the
|> standard include directories
|>
That does not affect the linker, only the compiler. You must specify the library via the -l option, you also should try to specify a path where the linker should search for lib files with the -L option.

Hope that helps,
Ulrich

If you use a ANSI-C compiler, then the Signals is built in. If not, there is a vector (0x102, note *4 to get the adress) that will be called when the program is terminated. You could intercept this and make a jump from here to a appropiate routine. Note that you have to be in Supervisormode to change that variable!

>use.

The obvious solution is to completely ignore the index file, a lot of QWK readers do. In almost all cases it is just the numbers 1,2,3, etc in order. Why they use a float format at all beats me.

Do you know the format of them? If not, find someone that's got MS basic (eg gw-basic or basica on a PC) and look in the manual. Actually doing the conversion isn't that difficult. They're six byte aren't they?, which makes it a bit difficult as it doesn't all fit into a long, but even so it shouldn't be too bad, just a lot of bit shifts and stuff.

It depends how badly damaged it is. the fsck supplied with minixfs can fix minor faults of the type you probably didn't know you had, more serious faults I think you would still have to lose everything. You don't have to lose other partitions though, just run minit again, but you don't really have to lose other tos partitions anyway if you have the right software.

i would like to know how the lcd display is interfaced to the stacy.
possible answers are like:
- there is a special area of the motherboard for the lcd, this area is not present on (say) a 1040.
- there is a special circuit which converts the monochrome video signal output for the use with the lcd.
i believe the stacy can also drive an atari monitor?
thanks!

6285. NVDI Fonts

s > Thanks.
s > Alan.

There are only few bitmapped GDOS fonts. I think you have better to update
your NVDI to NVDI 3.
NVDI 3 uses SpeedoGdos fonts, so you'll access to the Bitstream Fonts and the
True Type fonts.
Only the Postscript type 1 fonts which are supported by SPEEDOGDOS 5 are not
supported by NVDI 3.
But with Bitstream and True Type fonts, you'll have thousands of good vector
fonts, and it's quick to use !

6286. Back up hard drive on AUDIO recorder

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-23 11:50:48 UTC
From: steve-j@teleport.com
Message-ID: <3avaao$rg5@sandra.teleport.com>
Source record: 28951

Okay, we covered VIDEO recorder backups, so how about this:

What's the fastest possible rate that you could do backups on
an AUDIO tape (standard audio minicassette)? Assuming one had
a Falcon030 with stereo inputs and outputs, what's the fastest,
most compact method of saving/loading backups to/from audio
cassettes (in bytes/second)? In other words, would such a
utility be worth the effort?

Yes, but that's with *sound* data. An `ordinary' CD player has
error-correcting too. But if you have a stream of more or less
`random' data (like a backup of some program text) there's no way you
can easily repair data failures.

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/11/92
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these
pages may be found the latest news, reviews, software for downloading, and
various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as
intuitive as possible but there is still a lot of work to be done yet.

================================================================================

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~
```

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.
~~~~~

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
~~~~~~~~~

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- FOG issue 6 diskmagazine for Falcon
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.
~~~

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

- Lynx FAQ

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar. Although empty at the moment expect this to fill up very soon (lots to come).

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's, I hope to include AEO soon also.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

Does anyone know if you can use the new SIMM's on the Falcon.
I believe they were developed for the Mac and are 30mhz, or maybe 70mhz,
sorry I can't be more specific - but I'm sure that anyone who does know
what I am ranting on about can help! :-)

: at the same time?

The Systems Solutions Tower Case for the Falcon does pretty much what you want, but as for the bus adaptor, I don't think so. They also do the DeskTopper Case which IMHO looks a bit naff but certainly makes your Falcon set-up a little more expandable.

As for the 040 and PC board at the same time, go search out your DIY manuals I think :)

(hey get a shorter SIG file please!)

My Atari ST upgraded to 1 meg a few years ago does not boot up at all.
My monitor and disk drive are both on but does not work. Does any one
know what might be the problem?

6295. Help: MiNT & Papyrus

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-23 17:05:20 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3avsog$mv0@dux.dundee.ac.uk>
Source record: 28949

I cannot get MiNT and Papyrus (with Speedo 4) to run together. It always seems to exit MiNT on boot up.

I am using a Falcon (65mb HD, 4mb RAM). Also my Auto folder contains:

FOLDER256.PRG
FPATCH2.PRG
SPEEDO.PRG (I think thats what its called)
NVDI.PRG
FS.PRG
MINT.PRG

: >- Are there any parts which are known to break?
: >- There are some Hitachi-parts on the board which I can't buy here.
: > Are there any known replacements for these?

: They should be easy to fixed, I have fixed some 3-4 Atari PSU,
: but if its not your trade leave well alown..

The problem is, I cannot buy here theese Hitachi Semiconductors for
the PSU. But I am able to do the repair. The question is, do you
know any replacement types for the Hitachi Semiconductors.
The types are:
C2979 W9 B5 (probably a triac)
C2060 QQ
HRW34 9C 5
HA17 431P 9A

There has been other types of PSU with the classic transformer-
rectifier-condenser-threePinRegulator. But the Mitsumi type I
have in my ST is not one of these. It is a chopper PSU.
Sorry for my english.

Many Thanks for any help.

6298. HARDWARE solution for TIME SAVING

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-23 23:58:15 UTC
From: npetrlik@public.srce.hr
Message-ID: <3b0kun$7po@nippur.irb.hr>
Source record: 28901

Hi !

Does anyone knows how to save time after turning
computer off ?
I've haded instructions how to do this through
the ROM modul port (but the electronic
components - especially CMOS MSM5832 has not
been abled to me (MSM5832 is a clock chip)...
If someone wants , i may send him this instructions
in a file (actually in a picture file) ..
So what's bothering me ?
I know You all have TT's , Falcon's, Mega STE's ,
but i have only an old STfm (with only one MB - sigh)
with hard disc and modem ..
I'll be very grateful if someone could tell me or
explain me how could i do this 'time saving' ?
Or, at least, give me some hints about that ...

Gratefully,

Neven

P.S. I'm seeking for HARDWARE SOLUTIONS ONLY

6299. MFM/RLL or IDE HDD's to ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-23 23:58:38 UTC
From: hayden@ee.ualberta.ca
Message-ID: <3b0kve$fk0@quartz.ucs.ualberta.ca>
Source record: 28953

In the process of upgrading some PC-clone machines, I have acquired some smallish hard drives that no longer have a computer to call home. Since it is difficult to find someone interested in buying these drives (40 and 60MB 5 1/4" MFM/RLL-type) I was wondering if one of them could be put to good use with my 520STfm. It would certainly breathe new life into it without spending a thick wad of cash. Is there a relatively inexpensive adapter to allow me to hook one of these beasts up to the DMA HDD port on my ST? I could also obtain a small IDE drive at a low cost, so I would be happy with either an MFM/RLL-to-ST DMA adapter or an IDE-to-DMA adapter. Sometimes I prefer to use my little ST over my 486, and it would be even nicer if I had the extra megabytes of storage available. . .

Also when BYTE magazine did a review of these units for the PC a few years ago (1987ish maybe), error correction was not considered a big problem.

Basically everything gets written at least *4* times to the tape. The theory is that one of these blocks will read correctly.

When I enquired a couple of years ago about building such a device, the consesus was 'don't bother' but for different reasons. Its *slow* (apparently). I forgets the maths, but it was something like 1meg evey 3 minutes.

At work the other day we tried to back up 4Gb over a network. We got a respectable 3.75Mb a minute - but it was still going to take far too long. In the end we went out and bought a local tape unit ;-)

:-)

Hi !

Is there any software (program) support for ST
that i can use all the goodies of the Internet ?
I have an acess to Internet via my local host
and on the host there is a unix programs like
Mosaic, WWW, ... etc
When i try to start for expl. mosaic
unix says 'cannot open display' or something
like that.
Does exist some support for ST that i
should normally use the programs on my host
(i mean programs like Mosaic, WWW, Usenet, irc ..) ?

Thanx

You Don't need the Folder Fix program, its mainly for people that have TOS
1.0-1.2...

And with a small hard drive I don't think you would ever get 40 Folders deep,
or have 40 Folder open at the same time......

>error-correcting too. But if you have a stream of more or less
>`random' data (like a backup of some program text) there's no way you
>can easily repair data failures.

Find out about it. Error-correcting-code is a science. When I said "DAT",
I meant my DAT *tape backup unit*, not an audo DAT player. Error correcting
code works by cleverly interleaving redundant information into the data
stream. It is quite remarkable stuff, one of the few gems I enjoyed
finding in my undergraduate education. I don't even pretend to understand
the algorithm used by DAT tapes, but I am saying that techniques other
than read-after-write can ensure data integrity.

I have had a look at minit and seems that you can quite happily reclaim a minix partition with minit -t. Doesn't work on floppies though :-)

I was thinking about this recently, as the clock in my supra adapter does not work anymore. I was going to build a clock based on the Motorola MC146818.
This part seems easier to get, & is pin compatible to the Dallas 1287 part.
(The dallas part is superior, has a battery, but is more expensive.)

>utility be worth the effort?
>

This isn't as daft as it sounds - look at the old C64 turbo load games.
They got a really fast data rate from plain audio tape.

The DSP can do a deal of signal processing not available to the older
machines, so it should allow better usage of the bandwidth available
on a tape (20KHz or so?).

I would guess that some method involving the overlaying of 8 frequencies
onto one signal (one for each of the 8 bits in a byte) for simultaneous
storage would be the most effiecint. You could probably use lzh compression
on the data first (I believe the source for that is PD). To recover this
you would need to run an 8 point FFT on the DSP, but that would be no problem.
It should also remove some of the problems with reliability, as the frequencies
could still be picked up if the volume of the tape was changed.

Don't mail me for details, I'm waffling off the top of my head and have no
intention of actually trying any of this.....

>(The dallas part is superior, has a battery, but is more expensive.)

Supra took out the MC146818 from memory and replaced it with the Dallas
chip, I did the same for my Supra Board..

The MC146818 draws to much power in stand by, that is why Supra removed them,
the Dallas does not, the Dallas, clock chip with the built in battery last
for 10 years and is a very acurate clock....

There is also a Dallas Clock chip that does not have the internal clock
or battery....

Try running Mint without memory protection - MP 'loses' you quite a
lot IIRC by requiring that all memory blocks end on 8K boundaries.

What's FS.PRG?

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/11/92
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

==========

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document will describe the Atari Web pages as provided by Mark Stephen Smith and will inlcude a list of the latest updates for the month. Each month I hope to update this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but they are still at an early stage and developing all the time. As such any feedback and support you may have for these pages is more than welcome, it is infact encouraged. The more input I get from its users the better, as then I will know what is good and bad about these pages and can change them approproately in the hope of increasing their value to their readers.

Now on with the show.

==========

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these pages may be found the latest news, reviews, software for downloading, and various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as intuitive as possible but there is still a lot of work to be done yet.

==========

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~
~~~

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.
~~~~~

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
~~~~~~~~~

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- FOG issue 6 diskmagazine for Falcon
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.
~~~

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

- Lynx FAQ

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar. Although empty at the moment expect this to fill up very soon (lots to come).

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's, I hope to include AEO soon also.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

6315. IDE Harddisk and TT, possible?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-24 13:51:19 UTC
From: vongunten@eicn.etna.ch
Message-ID: <1994Nov24.135119.858@neli00>
Source record: 28975
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

A friend of mine wants to know if it is (easily) possible to connect an IDE harddisk into a TT. He got a drive (120MB) from a PC where this size was becoming too small...

(I believe there's an SCSI port, but no IDE inside the TT?)

Reply by E-mail preferred, please... Thanks

Dose anybody know of a program to display Jpeg files.
I have a 2.5M STE and want to be able to view the pictures in as many
colours as posiable, typical in greater numbers than 256. I know that
PhotoChrome will display in lots of colours for GIF and such but dose the
latist version do JPEG.

If you can mail me or to this group with details on were
to find this program it would be much appersiated...

Thanks.....

Yes you do, at least under TOS 4.01.
Running IOSMAIL always results in "out of internal memory - use folderxxx to get more, System halted" messages unless FOLDERnnn is run.

>Craig.

You may already have one of the best analog to digital converters, your
MODEM. Try recording the analog signal from the phone line. replay the
audio back into your MODEM when restoring the data.
I did this when testing a viewdata TV system (1200/75 Baud).
The old CP/M systems had a KANSAS CITY interface, which was 300 Baud and
worked very reliably.

I have been told that I also need it to stop memory problems with adding extra colour icons under TOS 4.04. Is this true?

If so, where can I get FOLDERnnn - I haven't seen it on any of the FTP sites....

I would rather hope to get a bit more storage than this would give me -
check the figures for a 2400 Baud modem:

2400bps == 300 bytes per second.

300 * 60 == 18000 bytes per minute.

18000 * 90 == 1620000 bytes on a standard C90 tape.
== 1582Kbytes
== 1.5Meg on a C90, and would take 1.5 hours to record.

Nice idea though....perhaps with one of those V.Fast modems it would become
practical (quick bit of maths)

28800/2400=12
12 * 1.5Meg give 18.5 Meg on a C90 tape - so things are still looking bleak.

==========BUT
as my friend has just pointed out, audio tape players are stereo, so you
can record on both channels, and also on both sides of the tape so....

If you have infinite patience & a V.Fast modem, you can get 74 Meg
onto a C90 audio tape - but it will take you 6 hours to do it.

Craig.

> effort?

I think you can get at least 2400 baud on a tape, though I've not tried anything in this area myself.

The main problem is that a C90 is not going to hold all that much data.

Eg at 2400 baud, assuming 10 bits a character = 240 bytes a second.

1 side of a C90 is 45mins = 2700 seconds

So 240 x 2700 = 648000 bytes or just over .6Mbs.

Of course thats almost optional. With any decent error correction, the amount would drop to about half a Mb.

So if you were lucky you might be able to back up .5Mbs per *hour*.

If a higher data rate could be used - then maybe worthwhile results might be achieved.

:-|

Roland.

@CiX

Disclaimer - these figures I worked out on the spot (in the early hours of the morning - so I might have got it badly wrong. OTOH I've always been interested in the possibility of using audio tapes for data backup - and whenever I do this calculation I get low results.

I'm not sure about your first question (though I'd suspect number two is the answer), but the STacy can definitely drive Atari monitors. It has a standard external monitor port, and can support color or monochrome ST monitors.

Quick question: How does one invoke the "secret dedication page" in Spectre 3.0? I have read about the thing (past versions played some sort of sample), but I have never figured out how to do it with 3.0. Just curious...

I fully agree.
From experience with a lot of customers, who often lost their data; I am quite capable of repairing a disk with a corrupt filesystem, even a corrupt FAT, but if the magnetism on the layer is too weak to get a reliable signal, it is really beyond repair. :-(

> There's usually no problems at all connected with using DD-disk with
> HD-drives and vice versa.

IMO there is no problem using DD-disks with HD-drives, provided the disk is of a fairly good quality, however, _not_ vice versa; you run a _serious_ risk using HD-disks in DD-drives.
That is due to the higher bias-current needed to format HD-disks.
(Which has been said already by Roger and others here on the net)

> IBM stated a long time that formatting a HD-disk with DD-format would
> destroy the disk, that is wrong, and they later took that statement back.
> But there is a considerably risk of dataloss if you do so.
> Because of the way HD-floppys work, and DD-floppys work, you can usually

> HD-format with DD-format,

In a HD-drive, yes. _Not_ in a DD-drive ! (see above)

> the other way around is also possible, but
> could cause dataloss.

Since HD-floppys are nowadays cheaper (!) than DD-disks, why would you bother :-)

> The difference between the two formats are that the HD-floppy writes the

> The DD-format could then with a bit of bad luck influence the HD-format
> in a bad way (the head picks up the DD-format together with the
> HD-format.).

I heard this story numerous times but I don't believe it, here's why :
There is _no_ technical reason why the heads or tracks written by a 3.5"

HD-drive should be thinner. There are not more tracks on a HD-disk, but
more *sectors* per track, 18 instead of 9. That also explains why the
magnetic layer is better and the bias needed is higher.
But both drives still format 80 tracks, and not more. So I can't figure
out why manufacturers would make the heads smaller / thinner, there's just
no reason at all to do this. Maybe someone involved in manufacturing can
post his opinion on this. BTW, with 5.25" drives the heads are _indeed_
thinner : 40 tracks / 9 sectors p. track (low density) vs.
80 tracks / 15 sectors p. track.

You don't have to modify anything, just plug in the FPU and it should work
fine. So I think the chip is defective. :-(Running at 16 MHz couldn't be
the problem, AFAIK.

I don't know what you have to pay for this, but I would go for a _real_
multiscan, typical 50-90 Hz / 31.5-65 Khz. Otherwise, a resolution with,
for instance, 53 Khz _could_ damage your monitor. A real multiscan
monitor is more flexible. They sell here at about 600-700 dutch guilders.
(dunno what that is in Pounds, sorry)

> cassettes (in bytes/second)? In other words, would such a
> utility be worth the effort?

Well, let's assume that each of the stereo channels has approximately
a bandwidth in the range of the telephone system. Current high-speed
modems are up to 28800 bps. The audio quality of a good tape
recorder is a little better than what you get from the phone
system, so let's assume you could achieve 30000 bps per channel
and 60000 bps for both channels, i.e. 7500 Bytes/s. On a C90
cassette, you could then store about 38 MB of raw data, but you'd
need 90 minutes for that. How much faster are those consumer
"high-speed" tape recorders which are used to copy tapes?

I guess that to secure the data against motor speed variations
and tape wear, you'd have to encode a significant amount of
error correcting data into the data stream, so the real data
which could be stored would be significantly less than those
38 MB, maybe only half of that.

6335. Help me with my Atari!

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-25 07:43:18 UTC
From: kamalH@ix.netcom.com
Message-ID: <3b44im$ohn@ixnews1.ix.netcom.com>
Source record: 28849

Greetings,

I've had my Atari Mega 4 ST for about 6 years, and I've been using it with an ADAP system with a 1.2Gigabyte hard disk for editing DAT tapes. My system just stopped working because the ST doesn't recognize my hard disk any more. I have the following questions:

a) I'm out of touch with Atari software that's out there so I don't know where to go to get the latest ICD drivers, hard disk utilities, etc.

b) Do you know of an ftp site or BBS where I can get some Atari ST software from.

c) Is there anyone out there with an ADAP system who can help me with the software ? The company (Hybrid Arts) is out of business I believe.

Thanks,

-Kamal Hyder (San Jose, CA, USA)

>put to good use with my 520STfm.
Yes. I had a 44MB Rodime 205E MFM drive and a Xebec S1410 SCSI-to-MFM
controller. What I did is get an ACSI (Atari HD interface) to SCSI host
adapter (ICD and others sell them). Connect the Xebec to the host adapter
and the disk to the Xebec. Then used ICD utilities to format the disk.

This setup has worked for 6 or so years now without any problems. Well,
that is... The speed is impressive: almost as slow as a floppy because
the Xebec won't handle interleave factors below 5 (not joking) and the
disk is 65 (or 85?) ms seek average (again not joking).

Other (faster) controllers exist. I think Adaptec 4000 or so is a
better choice.

>Nice idea though....perhaps with one of those V.Fast modems it would become
>practical (quick bit of maths)

The problem is that fast data rates are more susceptible to noise. With a
modem that doesn't matter, as the error correction either in the modem or the
transfer protocol just asks the remote system to re-send a block. Of course
with a tape recording you can't do that. With a good quality tape recorder
errors are less likely to happen, but they'll still cause serious errors when
they do.

After SHOUTING at the dealer I managed to get him to send me a 16MHz chip. Unfortunately it made no difference. My conclusion is that I'm probably stuck with a broken motherboard. After SHOUTING some more at my dealer I managed to convince him to send me a new motherboard. Considering how long it took for him to mail me the computer, I have no illusions about getting it before X-mas... ;-(

Well, I can at least run my computer when I disconnect the FPU.

: Try running Mint without memory protection - MP 'loses' you quite a
: lot IIRC by requiring that all memory blocks end on 8K boundaries.

I am running it with MP turned off, sorry I forgot to mention this.

: What's FS.PRG?

FS is a screen enhancement which allows higher resolutions. For example my
system is currently on 704 * 560 (I think).

OK, OK. You got me. As a matter of fact, half an hour ago I was
attending a class about these things (Hamming codes and such). I
thought you meant just writing it to an audio DAT. Audio codes are
much easier to correct of course. If you have a dedicated data backup
unit, you can indeed achieve amazing error correcting rates.

Sorry. Didn't mean to be stupid, or to make you look stupid.

BTW, I get bus errors using Elvis 1.7 nowadays (since I put it on my
Falcon. MiNT 1.12 (also with MultiTOS version), TOS 4.02). Any
hints? I'm glad I kept 1.6 :-) (Sorry, off-topic, but you ported it,
didn't you? Or was that Juergen Lock?)

There's another positive point: The max. frequency on tape is *much*
higher than over a telephone line. No need to restrict to telephone
line baud rates! (I saw 20 kHz quoted, but unless you have a
Nakamichi Dragon and use TDK MA-X tapes, I wouldn't trust that :-)
16-18 kHz on CrO2 tapes on any reasonable deck would do, though.)

Which is why any software writen to perform this function would include
some form of error correction (hamming coding) or redundancy of information
(double block sending). The limit of course is the quality of the analog
electronics/storage medium. You can improve this by using data certified
tapes which some manufacturers used to make.

In that case, you're running out of memory. Try reducing the Speedo
caches, or any disk caches that you have running.

Theres a little program called 'memwatch' that is available at hensa
that continuously shows you how little memory you've got left, in a
window.

Alternatively, maybe NVDI 3 will prove to be smaller than having NVDI
2 + Speedo 4 installed at once. System Solutions got their stocks of
NVDI 3 yesterday.

Well, it's not exactly a trivial thing to implement, and is has quite
wide-ranging effects on the rest of the OS in areas such as memory
management, file I/O etc. etc.

I also think (and this is conjecture) another reason is that there
just wasn't a standard Atari platform with an MMU when MiNT was first
desgined. Not sure how long the TT had been around...

6350. MiNT 1.12 - problems with AUX device

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-25 15:08:01 UTC
From: jensk@hpbbn.bbn.hp.com
Message-ID: <JENSK.94Nov25080801@hpbbrn.bbn.hp.com>
Source record: 28907

After installing MiNT 1.12 on my ST (I was running 1.09 previously), I can no longer receive characters from the serial interface (/dev/aux). Sending seems to work (my modem responds to commands, but its answers don't arrive). Does anybody know what could be causing this (and how to fix it, of course)?

Thanks in advance,

Jens.

From: atari@monet.name
Message-ID: <1994Nov25.162532.8289@imada.ou.dk>
Source record: 28865

Regarding Multitos and multitasking/threading, i have run into the following "problem". In my Othello game Stello, i have the interface and the "brain" (ab-minmax searching algorithm) running as two tasks. The interface is waiting in a Eventmulti for messages while the "brain" is computing the answer. The problem now is, how can i wake my interface from the Eventmulti. I my previous version, and in the next version (2.0 coming in next week) i have started the "brain" as a Gem program, and when it had finished it's calculations it sent a message with appl_write to the interface. All this works OK, but i would rather start the minmax alg. as a tos task so that the name of the task doesn't appear in the menu. My question now is, is it possible to start the brain as a Tos program, and then (when it has finished calculating) send a TOS! message to the interface to wake it from the Eventmulti call. What i mean are there any support in the multitos Eventmulti for signal's or other Mint calls.

Respond via Email (atari@imada.ou.dk) or in this group.

Thanks

6353. Re: Floptical Drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-25 20:35:36 UTC
From: edunmore@cix.compulink.co.uk
Message-ID: <CzuBvC.Mxq@cix.compulink.co.uk>
Source record: 28874

Help! Has anyone any experience of attaching Insite Floptical drives to pc (gulp - sorry)? It was connected to a 4MB Atari STe, behind a 105MB HDD and ICD Link as scsi id3. I want to connect it to 8MB pc via scsi(2) behind an Epson scanner, same id.

The suppliers suggested that parity-checking was disabled for Atari working and told me which contacts to re-short. I have tried every possible combination of three shorting sleeves on the four contact pairs available (including 0, 1 and 2 sleeve arrangements) and nothing changes.

The symptoms are that I can just about partition a disk under DOS, showscsi indicates a valid drive: fdisk says that the device isn't up to speed or set to read-only (Format under Windows produces a similar excuse for sitting on its hands).

Has anyone any suggestions? (Trashing the pc is ruled out, by the way). TIA for any constructive suggestions.

morris on!

Well the Microvitec (1438(?)) works fine with my STM. It also works fine
with my TT and PC (sure cut down on the number of monitors I need :-). Costs
about 300ukp. A mono/colour switcher box is about 30ukp extra. I got mine from
System Solutions (ssolutions@cix.compulink.co.uk).

:-)

I think this is the right reason. MiNT predates the TT by a year or 2. Also ISTR that Atari (US) had to give (supply/loan?) Eric R Smith (the author of MiNT) a TT so that he could carry on developement with a 68030 version.

The folder patch is required with ALL versions of TOS except MiNT/MTOS and
MagiC. It has nothing to do with depth of 40 folders or the number you
have open at any one time.

None of the folderix, poolfix, or other memory management patches are
useful when MiNT is installed. MiNT fixes all that stuff and uses a
completely different memory management algorythm. Don't bother with it
when using MiNT.

I know what you are trying to do, and I've been trying to push for th
for this for quite some time, to no avail. To answer your question, no,
it isn't possible. You might want to try doing 1 of the following .

1 Make both tasks GEM processes, but call menu_register
the second task with a NULL name, maybe that will suppress the name?
2 Make the second task a GEM one, but don't call
appl_init(). Instead use the global array from the parent when making
the appl_write() call.

Both are likely to cause problems, but see if it works.

3 The brain-process sends a signal (e.g. SIGUSR1) to the event-process,
which sends an AES message to itself from within the signal-handler.

I know, looks like asking for trouble, and I certainly didn't try it. ;)

Well, it IS a GEM program that uses a lot of text operations. The reason is that it's a CLI which has a few GEM features added to allow access to Desk Accessories, the file selector, etc... I don't have any problems with it under normal TOS. Everything works fine!

What's TOSWIN anyways?

Jon

6373. Atari ST does not work...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-26 16:40:28 UTC
From: jns0978@is.nyu.edu
Message-ID: <3b7ods$h4h@cmcl2.NYU.EDU>
Source record: 28900

The problem on my Atari 520ST upgraded to one meg first began when I booted up, all I got was an empty window displaying 0 files read. So I would try a few times more and it would finally read my disk. Then everything would be fine.

Other times the Atari would begin reading the disk only to either freeze or show the four bombs. Then I would have to re-boot and hope that the software would load into the Atari. Now the Atari does not read anything. The disk drive light does not go on when I insert the disk. I know the computer is on, as well as the monitor and the disk drive.

If this is enough info, please help me out. Thanks.

>You Don't need the Folder Fix program, its mainly for people that have TOS
>1.0-1.2...
Untrue. All TOSes will benefit from FOLDXXX.PRG. It is a must for TOS 1.0 and
1.2 but all TOSes are capable of running out of buffers if you have deeply
nested folders and use disk intensive programs, such as many comms OLRs and
mailers.

From: rrice@netnews.upenn.edu
Message-ID: <3b7pf1$8pd@netnews.upenn.edu>
Source record: 28893

To Whomever:

I just received a Belgian program called GHOSTLINK, which is supposed to allow an ST/STe/MSTe/Falcon to access a PC's hardrive partitions from the Atari TOS desktop over a null modem cable. I was hoping to use it with my Omnibook 300. The fastest I could get reliable directory readings was 4800 BPS over the null modem cable (with STalker/Procomm I've transferred files at 19,200), and I could NOT transfer larger files--the program would seem to hang up, or be working at a much slower rate than 4800 BPS. The program looked so promising... And it does allow TOS access to a disk, as long as you don't want to do anything, or so in my case. I have the HSMODEM drivers installed, and tried this on both my Modem 2 and Serial 2 ports on the Mega 4 STE. Input of any sort much appreciated.

Hi everyone !!
I have an ATARI 1040 Stfm, but it don't work !
The power supply just wissles,
and the +5V is just 1.8V
and the +12V is just 6V. What is the problem?
Can anyone tell me where i can get the schematic
of the power supply (MITSUMI model SR98).

You can send the repply directly to my e-mail !

Thanks and bye

>16-18 kHz on CrO2 tapes on any reasonable deck would do, though.)

Actually, I've got a great JVC deck (Dolby B C, Dolby HX Pro, DDRP, etc).
It gives the freq response for Metal, CrO2, and Normal tapes at normal
and -20dB. Try 30-16Khz for Metal tape! Now, if you want to make this
work on all decks, limit things to 50-12Khz tops, and then play all the
modem tricks (recording multiple bits at once with multiple modulating
carriers, and in and out of phase signals, etc). You might be able to
do 12 bits per channel * 2 channels * 10Khz = 30K/s. If your real tricky
and max it all out, you could do 50K/s safely. Not bad. That's 3MB/min.
Or 180MB/hour. I doubt you'll get that high though. 30K/s is likely
more accurate or 100MB/hour. A 1 hour tape is 30 mins/side, and you don't
want to keep data at the begin or end of the tape, so figure that you get
50mins out of it, or 90MB per 60 min. tape (90 min formats are not as
reliable, and 120 min formats are not even useable for audio needs!).

So .. that is my theory.

Gembench and Gemtest will use the blitter if it is switched on since both
of these programs do only make AES and VDI calls (AFAIK) to produce their
graphics output. You should easily see a difference between running Gembench
or Gemtest with blitter on or blitter off.

6382. Help with C programming

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-27 09:45:10 UTC
From: leslieh@warpcon.ersys.edmonton.ab.ca
Message-ID: <EK2JDDURUp@warpcon.ersys.edmonton.ab.ca>
Source record: 28913

Please reply to me, as the fellow doesn't have an internet
account.

I'm building a flowcharting program using an object tree as a page
of the flowchart. The symbols are icons with children that are strings.
The lines are user-defined objects with no children. The parameter passed
to the routine to handle the user-defined object consists of a list of
objects to connect.

The first object is the orgin object. The rest of the list
contains the objects the first object is connected to. It also contains a
string that is the label for some of the lines (such as labeling a yes and
no branch in a decision).

The things that I need to know are:

- How to insert an object or objects into an object tree,
maintaining the rules for a GEM object tree (such as the
root object has to be the size of all the children,etc).
- The best way to delete an object in a tree.
- How to print an object tree keeping it compatible with
the majority of Ataris.
- How to save an object tree so that rsrc_load can
understand that it is a tree.
- Perhaps some fast drawing routines for symbols instead
of using icons for symbol representation.

Thanks in advance for anything you can give me,

Blaine Brysh

Thanks.

Leslie

GEMBench tests the Blitter indirectly - all graphics tests are affected by
the Blitter but most significantly the Blitting and VDI Scroll tests.

yBecause Atari own the rights as they asked for it to be ported. Until such time as Atari give their consent to a PD release, it stays otherwise.

I have been going between Insignia and Atari on this but people at Atari either ignore my enquiries or say 'There's no cash for us so we wonbt look at it'. To be honest, I'm close to giving up.

I've made software for the ST that can use the build-in paralell-port
transfer system in the portfolio. It's very fast. To use it all you
need is to buy it (and to make a small change to the paralell-cable)

The other option is RS-232, but then you need to get a comm-prg for
your portfolio, and you need a way to get it on to the portfolio :-)

Lars-Erik 0sterud Phone +47 67131571 BBS/fax +47 67132659
Atari Developer Pager +47 96634222 larserik@oslonett.no
SysOp ABK-BBS Work +47 22956938 leo@merkur.sds.no

PortLink ST File transfer between Atari ST/STE/TT and Portfolio
""""""""""" """

PortLink ST is a small easy-to-use GEM-based program that uses the
parallel-port on your ST/STE/TT, a patched parallel-cable, and
the Portfolio's parallel-port and build-in file transfer system.

To use PortLink ST you need a parallel-port and cable for your
Portfolio. Then you need to buy the ST-software I have written,
and you need to patch the cable (that's included in the price).

BTW: The transfer speed is much faster than with the PC-version !

PortLoad VT-100 communication software for Atari Portfolio
"""""""" """

This is a fully-working demo-version of a communication program
for the Portfolio developed by a employee at Atari in Norway.
The program supports 80x25 screen emulation and file transfers.

Have you tried STree (1.04)? It's the only other one I know of that can search for files that contain a substring anywhere within their names.

It's got a decent interface, and the docs are in English.

|> gr. Marc Laan-Amsterdam-Holland
|>

I don't think this problem is related to the driver software.

Look under the Megafile. You will see a set of three dip-switches.
Switches #2 and #3 are used to set the ACSI device number. No need
to touch those. Switch #1 is a hardware setting that controls the
second SCSI connector inside the Megafile. The "off" position disables
the secondary drive.
I bet that if you flick dip switch #1 to the "on" position, your
CD-ROM will be recognized. Good luck!

One easy method of distribution is to uuencode the files and email them
to me about 2 days apart (so I have a chance to download them). I'll then
ftp them to a.a.u.e for you :-) Oh .. I'll even sanity check them to
be sure the archives are good (drool drool) yeah! test them .. that's
it! (sinister laugh!)

Could it be? Objective C? Real run-time type information and OOP in a
compiled C language? WOW!

> The distribution contains 3 zoo files gcc161[abc].zoo would
> you believe. And contains gcc, g++, cc1, cc1plus, and cc1obj,

> and the Objective-C container class library.

The container class lib too? Jeez, your breakin' my heart :-)

Thanks,
Evan Langlois

There is no difference at all, the two files are identical. When you boot the
kernel searches for a file called '/auto/mintnp.prg'. If it exists then it
doesn't try to do memory protection, so renaming the file turns memory protect
on and off.

As your STe can't do memory protection anyway (you need an '030 or better) it
doesn't make any difference to you.

Interrupts are normally run in supervisor mode (main processor ones are
anyway, not sure about MFP ones etc, I don't know whether the MFP interrupt
despatch code switches back to user mode first) and MiNT won't context switch
supervisor mode programs.

This is done deliberately so interrupt code is reliable, but has the
unfortunate side effect that disc access holds up the whole system.

You should either stick to text based stuff, and call the program .tos or .ttp so that toswin/miniwin is used; or make it a proper GEM program that runs in a window. Programs that mix gem and text-mode output are definitely out.

I don't think there is a way; not a legal one anyway. Generally accs shouldn't
allocate memory. If you're using Lattice C, and probably others, you can set
it to malloc from a static memory block in the bss.

MiNT is a fast pre-emptive multitasking kernel for the ST with support for loadable filesystems, loadable device drivers, signals, pipes, shared memory, sockets (with Mint-net) etc. You can only run one gem program at once as the aes in the roms doesn't support multitasking. It is the kernel of MultiTOS, a multitasking gem environment.

MiNT is freeware, MultiTOS is a commecial program and, in the released version, unusably slow.

That looks like a re-entrace of the AES to me. I am pretty sure this
will hang MTOS completely (so much for error recovery under MTOS...)

6406. MiNT ideas

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-28 13:15:42 UTC
From: apb25@cam.ac.uk
Message-ID: <apb25.15.000D4368@cam.ac.uk>
Source record: 28937

I might be an idea to have a list of possible new features for MiNT-

- key to switch between applications - (like Alt-Tab in Windoze)

- key to refresh screen for when applications crash or don't work properly

- fix so that the last two clusters on a disk can be used (it would probably be safer to have it built-in reather than relying on an external program - also who wants a folder full of fixes - speaking of which what fixes do you need with MiNT, and which ones don't you need (Ste 1.6) poolfix4,shelfix,aespath,copyfix?

- ability to alter window names by clicking on them - this would be a fast way to change path if you were looking at a directory tree or even if you were using a word processor.

Finally has anyone got fasttext to work - I cannot see any speed improvement using Gembench no matter how hard I try (with HARDSCROLL=25, setenv HARDSCROLL=25, CON=U:\dev\fasttext absoloutly everywhere - HARDSCROLL=25 in MINT.CFG gives an error - I am sure this is what it says to do).

Finally again, where should MINTNP, GEM.PRG (or should I use INIT = G:\mint\gem.sys), NVDI, XAES, WINX go in the Auto folder - and does anyone think installing PowerDOS is worth it?

6408. GCC 2.6.1

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-28 13:41:28 UTC
From: ljp@cck.coventry.ac.uk
Message-ID: <3bcmm8$3ul@cc_sysk.coventry.ac.uk>
Source record: 28791

A port of GNU GCC 2.6.1 is ready for uploading. I have placed
the files in Simon Gornall's incoming area, and hopefully he
will be able to upload the files to umich in the near future.
Actually I hope he is reading this because domain name of his
return address is unknown to my mailer. I've posted a message
to postmaster@kcl.ac.uk in the hope of resolving that but
don't hold your breath.

Some Notes on the PORT

This is complete port of GNU GCC version 2.6.1 it includes the
C, Objective-C, and C++ compilers, along with the libg++ library
and the Objective-C library, the man documentation and the online
texinfo manuals for emacs.

The compilers appear to be pretty stable I've only found two C files
that caused any problems (and that was with optimization turned on
and compilation of a couple of large functions from the gdb-413
distribution). No problems have been found with the C++ compiler
and the ObjectiveC compiler has compiled its class library and
passed the supplied checks (except for the socket and server tests
as I haven't got MintNet running yet.)

In C++ the CursesW class is unimplemented because I don't have a
cplusplus aware curses.h file. The source is included in gcc161a.zoo.

Testing has only been done under MiNT1.10 and you will need to be
using a minix filesystem, or something that allows proper filenames.

This distribution is contained in 3 zoo files:

gcc261a.zoo - contains the documentation files, gcc.ttp
g++.ttp, cpp.ttp, the header files, the
pseudo-prototype libraries and some additional
support code for the gnu.olb library.

gen/* -- psuedo prototype files
g++-include/* -- g++ specific header files
man/* -- nroff manual files
cat/* -- nroff formated manual files
bin/* -- compiler interface programs
info/* -- emacs online info files
include/objc/* -- objectiveC runtime header files
genclass.sh -- shell script for /bin/sh
genclass.tcsh -- shell script for tcsh
gcc-lib/cpp.ttp -- preprocessor program

```
gcc_lib/op_vnew.c -- new support functions

Disk requirements 3215425

gcc261b.zoo - contains the C and C++ compilers.

gcc-lib/cc1.ttp -- C compiler proper.
gcc-lib/cc1plus.ttp -- C++ compiler proper

Disk requirements 2595304

gcc261c.zoo - contains the Objective-C compiler and libraries.

objects/* -- ObjectiveC class header files
gcc-lib/cc1obj.ttp -- ObjectiveC compiler
gcc-lib/objc.olb -- ObjectiveC runtime library
gcc-lib/objects.olb -- ObjectiveC class library
gcc-lib/g++.olb -- C++ class library

Disk requirements 2581090

Setting Things Up
-----------------
The control programs gcc.ttp and g++.ttp can go anywhere in your
PATH, the compilers cc1.ttp, cc1obj.ttp, and cc1plus.ttp like to
be in /usr/local/lib/gcc-lib, but you can use GCC_EXEC_PREFIX to
change that. The cplusplus header files like to live in
/usr/local/lib/g++-include, your C header files in
/usr/local/lib/gcc-lib/include, the Objective-C runtime headers
in /usr/local/lib/gcc-lib/include/objc, and the Objective-C in
/usr/local/lib/gcc-lib/include/objects. Actually the preprocessor
will look in a range of places for the headers (use the -v option
to discover exactly where and the order of search). In addition you
can still use the GNUINC and GXXINC environment variables, however
the preferred environment variables are C_INCLUDE_PATH, CPLUS_INCLUDE_PATH,
OBJC_INCLUDE_PATH, and OBJCPLUS_INCLUDE_PATH, for headers that can be used
by either Objective-C or C++. Use the Unix type path seperator ':' the
atari seperators ';' and ',' will probably still work though.

Notes on this port.
-------------------

I've changed the way in which the linker is called, it is no longer
necessary to specify -lgem, as this is parameter is always passed to
the linker, as the penultimate parameter before -lgnu, with g++ you
get -lg++ -lgem -lgnu. I've done this because I tend to use gem.olb
most of the time and normally forget to specify it when compiling
directly from the command line.

The g++ library has been compiled to use its own form of stdio.h which
should be kept seperate from the stdio.h that comes with mintlibs. You
should, however, be able to intermix C++ stream output with stdio output
without trouble.
```

GCC 2.6 uses two new builtin functions for allocating and deleting arrays
these two functions are in op_vnew.c, which should be compiled and added
to gnu.olb or mint.olb. You will find this file in gcc261a.zoo

Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi,
I wonder if anyone can help. I am looking for a guide that tells me the speed of instructions on the 68000. In particular, I am trying to find out how many memory-to-memory ADDs can be done per second. Also, does the addressing mode affect the speed.

eg, is ADD.W (A0),(A1)+
faster than ADD.W (A0)+,(A1)+ ?

The reason why is that I am helping to write an FFT program in DEVPAC, and I need to find the fastest instructions.

TIA,
Steve

P.S. Email replies preferred, but posted replies OK.

I don't really think this will work!!?? Will it??
As far as I know the syntax for 'add' is:

add.x Dn,<ea>
add.x <ea>,Dn

That makes it about 0 add's/sec.
Usually (An) and (An)+ uses the same amount of CPU-cycles!!

6413. Faster MIDI-ports

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-28 14:47:53 UTC
From: der@discovery
Message-ID: <DER.94Nov28154753@discovery>
Source record: 28794

I`m running a small network between a MSTE and a Falcon using MiNTNet over the MIDI-ports. Everything works alright, but at 31250bps it`s a bit too slow for my needs (FYI all other interfaces are occupied).

After having looked through some hardware documents I noticed that it looks possible to feed the MIDI-ACIA with a higher frequency (or a lower and disable the divider). Have anyone had any experience with this kind of modification? How fast would it be possible to go? Would the optocouplers be able to keep up with anything higher than 31250?

Please note that the From-field in the header is incorrect.

Hi All,

I'm looking for ISBN numbers of detailed technical manuals, books and/or references for the (I have a 1040FM) ST. I'm particularly interested in addressing information for the cartridge port and parallel port, but would like such guides in general.

I understand there is one called the ST Compendium, but I have no publisher information. If there is a FAQ listing of references maintained somewhere, can it please be forwarded to me via email.

Otherwise, if you have a good technical ST book, can you post me the details.

Hey, if you're selling, I've got the $$$;-)

All answers appreciated...

|> I don't really think this will work!!?? Will it??

Shit! I hope so! I'd rather not have to use 2 instructions...

|> That makes it about 0 add's/sec.

Not very fast then... :)

Okay then, how about:

|> Usually (An) and (An)+ uses the same amount of CPU-cycles!!

That sounds good!

Steve

In article <3b0mgq$82i@nippur.irb.hr>, npetrlik@public.srce.hr (Neven Petrlik) writes:

Hi !

Is there any software (program) support for ST
that i can use all the goodies of the Internet ?
I have an acess to Internet via my local host
and on the host there is a unix programs like
Mosaic, WWW, ... etc
When i try to start for expl. mosaic
unix says 'cannot open display' or something
like that.
Does exist some support for ST that i
should normally use the programs on my host
(i mean programs like Mosaic, WWW, Usenet, irc ..) ?

Thanx

Mosaic is trying to open a window on an X terminal somewhere.
Unfortunately your ST is presumably emulating a character-based
terminal (VT52 or VT100), so no go.

You should be able to run lynx, if that's available at your site,
but this will give you a text-only interface. To successfully run
mosaic on your host you would need to have both TCP/IP and an X
server running on your ST; the former exists as a part of KA9Q,
but the latter currently only exists as expensive payware.

In the new year things will improve: Linux 68k will be released, a
free X port will probably follow, and someone is working on a WWW
browser for the ST. So there is help on the way (although you may
need to enhance your hardware along the way).

>

I think you have to fiddle around in your basepage, replacing the
pointer to your basepage with the pointer to your parent's, or
something like that, whenever you do a Malloc(). Replace the value
afterwards, of course. This has the effect of fooling GEMDOS into
thinking the AES has Malloc'ed the memory, not your DA, and thus
memory you allocate hangs around.

I don't know if this technique is required or even possible under
MultiTOS.

From: bericd@bri.hp.com
Message-ID: <Czzp23.1vK@bri.hp.com>
Source record: 28801

Hi all,

Has anyone tried the PAK 68/3 accelerator board on an STFM ?

If so what is the performance/compatibility like? I know a 68030 clocking 33 MHz is going to be fast - but what will be the effect of having to slow down to access the rest of the chips ?

My current hardware is an 520STFM upgraded to 4MB, with Magic O/S, SCSI Hard Disk - so the only real way to upgrade is a) get an accelerator like PAK 68/3 or plump for a Falcon or TT. As I am not bothered about 2 squillion colours on screen or brilliant sound this would hint at a TT. Hence is it worth spending the extra 500 quid or so on the TT or get PAK 68/3 or similar?

Any views would be appreciated.

Beric Dunn.. bericd@hpcpbla.bri.hp.com

6421. Weird Operating systems. (And GNUplot.)

: the Eventmulti. I my previous version, and in the next version (2.0 coming
: in next week) i have started the "brain" as a Gem program, and when it had
: finished it's calculations it sent a message with appl_write to the
: interface. All this works OK, but i would rather start the minmax alg. as
: a tos task so that the name of the task doesn't appear in the menu. My
: question now is, is it possible to start the brain as a Tos program, and
: then (when it has finished calculating) send a TOS! message to the
: interface to wake it from the Eventmulti call. What i mean are there any
: support in the multitos Eventmulti for signal's or other Mint calls.

: Respond via Email (atari@imada.ou.dk) or in this group.

: Thanks

MiNT provides several ways of doing Inter-Process Communication: pipes,
signals, or shared memory segments. All will allow tos/gem comms, for
example, TOSWIN is a GEM program but uses a TOS program called RUNTOS which
communicates with TOSWIN via a pipe to tell it to run/setup TOS programs in
a window.

Straight FAX from Toad computers (1-800-448-TOAD) is supposed to be the
cream of the crop for Atari FAX software. I have heard nothing but good
things about it. There is a test program on atari.archive.umich.edu which
will tell you if Straight FAX will work with your modem (plus lots of other
things about your system). I believe it is called sysinfo, but there are
several sysinfos on there :-). Look in the index to find the correct one.

I think the Compendium deals mostly with programmatic interface issues, but I could easily be wrong. I seem to remember that the table of contents was posted at some point, so perhaps someone could dig it up and repost it.

> Otherwise, if you have a good technical ST book, can you post me the
> details.

There is a lot of hardware info in Tacklebox ST, a huge 4" thick 3-ring binder of information designed for use with Personal Pascal. It is a bit old, but since you have a 1040STFM, all of this info should be pertinent. There is some very low level stuff in there, including some Motorola manuals. A majority of the manual deals with Personal Pascal stuff, but I'd say a good inch of it is hardware info. It has answered every hardware question I have ever had about my older STs.

> Hey, if you're selling, I've got the $$$;-)

Hmmm, let me ponder this. I have only used it about three times in 5 years, but those three times were kinda important :-). I'll see if I can find an ISBN on it in any case. Oh, it comes with some disks as well, again intended for use with Personal Pascal.

I've never tried that...

>> 2 Make the second task a GEM one, but don't call
>> appl_init(). Instead use the global array from the parent when making
>> the appl_write() call.

I've tried this. It won't work, because the AES context is also kept on
a per-process basis.
>
>3 The brain-process sends a signal (e.g. SIGUSR1) to the event-process,
> which sends an AES message to itself from within the signal-handler.

>I know, looks like asking for trouble, and I certainly didn't try it. ;)

This also fails, I've tried it as well. The only solution is to make both
tasks GEM processes. Maybe the NULL trick will work in menu_register, I
dunno, but it's worth a try. Otherwise, you just have to live with two
menu bar entries...

(3 fails because the AES cannot be called from a signal handler. The only
way I found to generate an AES event from within a signal handler was to
write a message down a pipe in the signal handler, with a child process
doing a select on the pipe. The child process then sends an AES message
back to the parent. It's really gross and disgusting, but it works.)

Originally Eric Smith wanted to implement AES messages thru MiNT pipes,
which would have made everything wonderful, but I guess that area of code
had already been declared frozen, and couldn't be changed. Unfortunate.
Perhaps one could write a new AES handler that operated this way, anyway,
and ignore the built-in code...

68000 reference guide
Richard Woolcock, Anthony Burkitt
Melbourne House Publishers
ISBN 0-86161-166-7

68000 assembly language programming
Gerry Kane, Doug Hawkins, Lance Leventhal
Osborne/McGraw-Hill
ISBN 0-931988-62-4

I would prefer the first, YMMV.

> In particular, I am
> trying to find out how many memory-to-memory ADDs can be done per
> second. Also, does the addressing mode affect the speed.

Yes, different addressing modes have different execution times. But the
overhead for address register indirect is the same as for address register
indirect with postincrement (predecrement takes an extra 2 clock cycles).

> eg, is ADD.W (A0),(A1)+
> faster than ADD.W (A0)+,(A1)+ ?

The add instruction handles only <ea>,Dn or Dn,<ea>. You would need two
instructions:

```
move (a0)+,d0 ; 8(2/0)
add d0,(a1)+ ; 13(2/1)
```

Regards,
Waldi

Gembench is a GEM application! The fasttext device is not a VDI accelerator,
use NVDI instead. The fasttext device is usefull if you run your system
in textmode (ie. without the cpu/memory hog, called AES ;)

> Have you compiled MiNT with -DFASTTEXT? It's not enabled by default,
> i think.

If MiNT was compiled with -DMULTITOS the fasttext device used to be _not_
included, otherwise it was. I assume this remained the same with 1.12(?).

> Any views would be appreciated.

I was in a similar situation. I wanted to do more C programming but was finding memory and CPU constraints.

I looked *very* hard at the PAK/3, even to the extent of going to a show in London to see it.

However in the long run I plumped for a second hand TT. The cost difference between upgrading my MSTE with a PAK/3 and buying a second hand TT was not all that much. Taking into account what I got for selling my MSTE, the difference was very marginal.

The TT though has many extra features. TT-Hi (1280x960 paperwhite screen) and more memory expansion (mine came with 8Mb). In your case you would also get a VME bus and a fast serial port extra (among other things).

True - the PAK/3 is faster, especially if you have a 40 or 50Mhz version. OTOH untill they sort out TT Fast RAM for it, a genuine TT with TT Fast RAM actually out performs it in the tests I done (dhyrstone).

Roland.

Hmm, I'd offer to upload it, but I can never get on
atari.archive.umich.edu, and it's pretty gross to send something that
huge through the email.

You should probably try contacting Simon Gornall or someone else in the
UK with decent FTP access to help you... You could also ask someone
from the atari.archive team to help out. I've still got a nice
MiNT-only (AFAIK) port of GNU make 3.71 sitting around to upload
somewhere; so far I've only managed to get it on ftp.germany.eu.net...

Many more thanks to all who have responded about my problems in getting the Omnibook 300 to link to my Mega 4 STE with GHOSTLINK.

I have tried all three serial ports, and gotten the same results, and I have disabled every auto program (including the HS serial driver patches and gotten the same results, which are--

1)A bad link (directory with SLAVE ERRORS) at 9,600 BPS, and no file transfers from the Omnibook. I get (TOS commands echoed)

Open File [File Name] Return 1
Find First [File Name] Return 0
Read 4096 Bytes [1] pos: 0 Return: 0

And then freeze city.

2)At 2400 bps or lower I get the same but then the rest of the file in increments until I get (at length) the whole thing.

I'd say it's the Omnibook, but I can't be sure there, either. Obviously there's a 4k buffer involved, but what appears to be happening are nasty protocol errors--on a null modem cable? With PROCOMM/STALKER I get 19,200 BPS with no errors.

Is there one so great of brain that he can solve two computer problems at one time?! No use looking here... I don't have another DOS machine on which to experiment, sadly.

>> application.
>
>appl_id is 0 for programs and >0 for ACC's (<0 if GEM not initzialised)

No, appl_init returns >= 0 for programs (esp under MTOS!)

I think that DAs are called with an address register set to zero,
possibly a0, but I can't remember precisely because it is all handled
by startup code...

If you are using the Mintlibs, there is a global variable called _app
which will tell you if you are a DA or a program. If you are using
Lattice, check the documentation for _XMODE.

Message-ID: <10398@falcon.ukc.ac.uk>
Source record: 28553

I wrote (jpb3@ukc.ac.uk) wrote:

: Well, for the past week or so I've been cursing anyone who reads this group
[snip!]

```
: struct bintree
: {
: int num;
: char *string;
: struct bintree *left, *right;
: }; /* Binary tree struture */
```

: How can I implememnt this in LatticeC, if the above structure is supposedly
: "invalid"?

As much as I hate following up to my own pieces, I thought I had to for this,
as the piece of code I posted works perfectly :-(

The code I had tried in LatticeC was:

```
struct bintree
{
int num;
char *string;
struct bintree *left, right;
}; /* Binary tree struture */
```

Anyone notice the small difference? It seems I won't need any help now....:-)

6438. MiNT 1.12 & bus error ....

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-29 09:44:57 UTC
From: plord@novell.co.uk
Message-ID: <3bet6p$3ve@bird.summit.novell.com>
Source record: 28819

I've been trying to get cron working on my ST - I suspect that modern versions of MiNT cause a bus error when trying to start off a daemon.

My code looks something like this (from memory - but you get the idea) :-

```
switch (fork())
{
case -1: error;
break;
case 0: /* child */
do_routine;
break;
default: /* parent */
exit (0);
}
```

Using this, however, the parent doesn't die (just sits around waiting). The child appears to be working.

If, in the child case, I try to kill off the parent using kill(getppid, SIGKILL) I get the bus error.

So, is there any way to start off a daemon using MiNT which doesn't result in a bus error.

Thanks,

Pete

Yup, this is correct. If you look at the code for my screen blanker,
ST-Blank, this is how it can tell if it's been started as an ACC or
stand-alone. You can get the code from the Atari Archive at the
U.Mich. FTP site.

Lattice uses the same technique.

This is because of the lack of virtual memory support under MiNT.
When you fork(), the parent is blocked until the child terminates.
What's wrong with just letting the cron program run in the background
without a controlling terminal? Do you need to use fork()?

Look in HENSA...you will find the ST version of GnuPlot there. This is
version 3...in package o083 (if using the web or gopher, then just do a
WAIS search for the string plot). version 3.5 will be appearing here
soon, too.

Recent ssue of ST Applications had a review of GnuPlot...very
interesting it was, too. :-)

6447. BSD 4.4 or Linux

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-29 15:05:19 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <3bffvf$4rm@percy.cs.bham.ac.uk>
Source record: 28826

Whilst both Linux and BSD are free operating systems, it seems to me that people want to install Linux and not BSD. Why is this? From what I understand, Linux is a bit of a hack, whereas BSD is quite a well-proven piece of software, and hence more robust than Linux.

How difficult would it be to port BSD 4.4 onto an Atari platform? I see (from comp.unix.bsd) that it has already been ported to 680x0 (where x > 3 probably) and is available on Amigas and Macintoshes.

Does anyone else think that a BSD 4.4 port would be a nice thing to have on our Ataris?

6452. Packers and UNIXMODE

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-29 16:41:26 UTC
From: t150315@proffa.cc.tut.fi
Message-ID: <t150315.786126402@proffa>
Source record: 28832

Some of the packers (lharc, stzip) seem to understand UNIXMODE enviroment variable setting ru (convert '/' to mean u: drives root) wrong. If I have that in my UNIXMODE variable (as some 'former' unix programs like Lynx need it) lha doesn't find files unless they are accessed through u: drive. For example: I'm in c:\source\c\ and try to pack using
lha a -r m:\test.lzh a.c b.c

It doesn't work. If I remove the 'ru' from the UNIXMODE or try the same in u:\c\source\c\, everything works just right...

Comments?

Btw. Lynx needs 2MB to parse a 100k of HTML. Another thing is that when trying to run an external viewer, Lynx copies the current file (eg. gif) into temp as a .html file. Not good. And if the ST lynx has the same bugs that our Unix Lynx has too... :-(

The following is a hucksterish plug for Toad Computers Holiday Festival '94 which will take place this coming weekend at Toad Computers in Severna Park, Maryland. If you are unable to attend or are not interested in reading about the show, please feel free to skip this article. Thanks -- from the folks at Toad Computers.

TOAD COMPUTERS -- HOLIDAY FESTIVAL '94! -- DEC 3 & 4, 1994
==========

== THE SHOW IS APPROACHING FAST! ==

IF YOU'RE LOOKING FOR ATARI EXCITEMENT, DON'T MISS
TOAD COMPUTERS HOLIDAY FESTIVAL 1994!

The show will take place at TOAD COMPUTERS in the Park Plaza Shopping Center in Severna Park, Maryland. There's unlimited free parking and lots to see and do nearby, as we're nestled between Washington, Baltimore, and Annapolis (eat the great local seafood!).

Confirmed 1994 attendees include:

- Tom Harker, ICD Inc. (CatBox and Star Battle)
- Roger Burrows, Anodyne Software (ExtenDOS CD Driver)
- Gribnif Software -- Dan Wilga / Rick Flashman
- Wizztronics (Falcon enhancements & more)
- Bob Luneski, Oregon Research
- Jim Fouch, Fouch Software (Mailing Manager ST)
- MajicSoft
- Binary Sounds (Hybrid Arts Product Line)
- Joe Waters, Ed. of Current Notes
- Greg Ondo, Steinberg Jones
- Charles Smeton (STraight FAX!)
- And of course, the Toad Gang -- including
Dave and Jennifer Troy

ATARI ST / TT / Falcon, Jaguar, Lynx, Portfolio and 8-Bit!!
Come SEE IT ALL at the nation's premier ATARI Outlet!

TOAD COMPUTERS HOLIDAY FESTIVAL '94:

Saturday December 3rd 10:00am - 7:00pm
Sunday December 4th 10:00am - 5:00pm

show. For more information, please call us at (410) 544-6943!

LOTS OF FOLKS KNOW ABOUT THE SHOW:

- 5000 Postcards Mailed in mid-November
- Featured on the back of our latest catalog
- Advertised in Current Notes & ST Informer
- Advertised Electronically (Internet et al)
- Highway Signage

SPECIAL ICD PROMOTION:

ICD is offering a special promotion at the show. Buy an
AdSpeed ST/STE for $159 _INSTALLED_. The board will be
installed & your computer shipped back to you FREE or,
time permitting, the board can be installed at the show --
ABSOLUTELY FREE!

This is a great opportunity to get your ST going faster
and save a little CASH! Bring your machine to the show
to take advantage of this great deal!

A SAMPLING OF WHAT WE'LL HAVE FOR THE SHOW:

- Falcon030's (LOW!) - Hard Drives
- TT030's - Hand Scanners
- 1040STE's - 450 Mice
- Stacy's - 125 Trackballs
- Mega STE's - Joysticks
- Laser Printers - ALL NEW SOFTWARE
- CD ROM Drives - STraight FAX! (Show Special)
- Monitors - Disks
- Power Strips - Mousepads
- Books - 8-Bit Hardware
- ST Hardware - Games
- DTP Software - Printers
- Multimedia Speakers - Internet Demos
- Lynx / Lynx Games - Jaguar
- NEW JAGUAR TITLES! - Codehead Stuff
- Printer Ribbons - FAX Modems

- Great deals on all hardware and software
- Full selection of Atari hardware & software
- Atari Falcon030 Computer Systems at Special Discount Prices

- Super Low Clearance Prices on a wide range of items
including discontinued hardware and software, store demo
equipment, and much more!
- Our Toadally Cool Dog, Zoe

- Free Hot Apple Cider (and cookies if you're good!)
- Special "Kid Korral" with fun stuff, like crayons
- Dave Small's Own "Live Rust" Neil Young Album,
The One To Which Spectre was Programmed!
- Demos of hardware and software!
- NETWORKED JAGUARS!

=== MUCH, MUCH, MORE! ===

OTHER COOL STUFF WHICH IS ON ITS WAY TO US (As We Speak):

- Over 14,000 ST Games
- ImageCopy 3.5CD (Supports Photo CD Pictures)
- NVDI 3.0 (New Version)
- MagiC (Newest Version)
- Desktopper (Falcon Case)

STUFF WE'RE GIVING AWAY:

- Jaguar System (Raffle to Benefit Habitat for Humanity)
- Jaguar T-Shirts, Mugs & Bumper Stickers
- Codehead T-Shirts
- Free Toad T-Shirts to First 25 Attendees
- Games
- Lots more!

How much would you pay to be a part of a celebration like this? $3.98?
$14.59? $75.00 Non Refundable? Well, no need! Admission to TOAD
COMPUTERS HOLIDAY FESTIVAL '94 is ABSOLUTELY FREE!

In the immediate area is historic and scenic Annapolis! Annapolis had
been the capitol of the thirteen colonies under the Articles of the
Confederation. Its historic state house is the oldest in use in this
country and its white dome was built without the use of nails.
Annapolis has a truly quirky personality that is a combination of
southern hospitality, northern charm and historic clout. For you
military buffs, Annapolis is the home of the United States Naval
Academy. It is open to the public and features several museums,
exhibits, and historical buildings. Annapolis is also home to some of
the best seafood in the world, straight from the Chesapeake Bay.

Toad Computers is TEN MINUTES away from downtown Annapolis.

Also nearby is Baltimore, home of the recently renovated and world
famous Inner Harbor -- a huge shopping and eating fiasco that's
just minutes from some of the city's most historic sites. In the
inner harbor area, you can visit the National Aquarium (home to
thousands of species of marine life) which also features a working

rainforest in its pyramid shaped dome. Visit the Maryland Science Center, home to a huge I-MAX theater and also packed with hundreds of constantly changing exhibits that relate to science, computers, and more. Visit the home of Babe Ruth, Betsy Ross, or Edgar Allan Poe. See the new stadium for the Baltimore Orioles -- Oriole Park at Camden Yards. You might also want to visit Fort McHenry -- the rampart that still stood after a night of bombardment in 1812 that led Francis Scott Key to write our national anthem to the tune of an old drinking song. Find out why this happened! Visit the B&O Railroad Museum where you can learn about the story of the rise and fall of the greatest form of transportation this country has ever known.

Toad Computers is THIRTY MINUTES away from downtown Baltimore.

Lastly, you may want to make a stop in Washington DC -- murder capital of the world and Capitol of the United States. Where else can the mayor of a city smoke crack and get RE-ELECTED? Come see the White House -- maybe you can visit Bill Clinton at home and give him your ideas for healthcare reform (yeah, like we're gonna see that anytime soon). Visit the Smithsonian Institute, National Art Gallery, countless memorials (Iwo Jima, Viet Nam, Jefferson, Lincoln, Washington Monument), and more. There is more to do in Washington than I could ever begin to list here with any justice. If you do want to go to Washington, check with AAA to make sure that you're not missing anything. It is truly a city with something for everyone.

Toad Computers is FORTY FIVE MINUTES away from downtown Washington.

HOTEL ACCOMODATIONS

If you plan to visit the Annapolis area from out of state, there are several hotels in the area that we may recommend:

Sheraton At BWI Airport 15 Minutes Away
(410) 859-3300 On Airport Grounds

Loews Annapolis Hotel 15 Minutes Away
126 West Street Downtown
Annapolis, MD 21401 AAA 4 Diamond Rating
(410) 263-7777 Somewhat Expensive

Days Inn 10 Minutes Away
1542 Whitehall Road Next to Outlet Mall
Annapolis, MD 21401 on U.S. Route 50
(410) 974-4440 Near Bay Bridge

** Holiday Inn 15 Minutes Away
** 6600 Ritchie Highway On Ritchie Highway
** Glen Burnie, MD 21061 (MD Route 2)
** (410) 761-8300 SPECIAL $59 RATE!

Historic Inns of Annapolis For you lovebirds who
(There are several) are just dying to
Church Circle have a romantic time
Annapolis, MD 21401 in the "ancient city."
(410) 263-2641 15 Minutes Away

For more information, please call Toad Computers at
(410) 544-6943.

==========

OK! So you're coming! TERRIFIC! Here's everything you need to know:

When: Saturday, December 3rd 1994 10:00am - 7:00pm
Sunday, December 4th 1994 10:00am - 5:00pm

Where: Toad Computers
Park Plaza Shopping Center
570 Ritchie Highway
Severna Park, MD 21146

So come see the Jaguar, see Falcons in flight, see Toad Computers (America's Atari Source and the only Atari Superstore), see the local attractions and have fun. And help us ring in the holiday season! We look forward to seeing you!

HOW TO GET HERE:

For a map to Toad Computers and the immediate area, see GEnie ST Roundtable file #25969 (PostScript) or #25970 (Img Format). Or just call and we'll FAX or mail it to you. (This is also available on TOADFAX!, our FAX-on-demand service.)

Come Visit! We're Expecting You!

From Annapolis: Cross Severn River using US 50 bridge (east).
Take MD 2 north (first exit across bridge).
Turn left at sixth traffic light (McKinsey
Road). Turn right immediately into Park Plaza
shopping center.

From Baltimore: Take I-695 (Baltimore Beltway) south to MD
route 10 (to Severna Park). MD 10 will
intersect with MD route 2 south. Take route 2
about 3 miles further. Turn right at sixth
traffic light, onto McKinsey Road, then
immediately right into Park Plaza shopping
center.

From Washington: Take US 50 (begins as New York Avenue) east to
Annapolis. Follow directions from Annapolis.

From Columbia: Take MD 32 east to I-97 north (to Baltimore).
Exit onto Benfield Boulevard towards Severna
Park. Follow Benfield Road to Robinson Road to

MD 2. Turn right onto MD 2; second light on
right is McKinsey Road. Then turn right
immediately into Park Plaza shopping center.

Once Inside
Park Plaza: Locate and face Jo-Ann Fabrics. Turn left and
proceed about 200 feet. We are on your left,
across from the Signet Bank drive-through
island.

The street address is 570 Ritchie Highway. If you need any further
assistance, please feel free to call us at (410) 544-6943!

We hope to see you here! Last year, we were really happy with how
things went. The holiday season is a really wonderful time to get
together with Atari folks and it adds a spirit of real levity and
excitement that is often missing at other Atari events. We're looking
forward to putting on a first-class show, and we hope you can join
us.

The justification for porting Linux as opposed to BSD is that Linux
is the de-facto standard for PC free Unix. That isn't to say it's the
best, it's just the most widely used. This means that there is a shit
load of new stuff coming every week for linuxPC, and most of it has
source distributions. 68K linux will give access to this large software
base.

>Does anyone else think that a BSD 4.4 port would be a nice thing to
>have on our Ataris?

Perhaps it would, but there aren't enough capable hands out there to carry
two Unix ports to the atari (there may not be enough for just the one...).

That's because MiNT only has a blocking Pfork(). Try working around it
using tfork() instead of fork().

How does a program put itself in the background without creating a
child and exiting the parent? (under MiNT tfork() can be used instead
of the blocking fork()).

You have to check a0 on program entry, checking the return value of
appl_init() was the old method IIRC, anyway a0 will be 0 for an application
or an accessory, I can't remember which way round it is though.

Yes, that's the one.

> Well the way it runs on my 16mhz Mega ST, I thought I had forgot to turn
> the Computer on...

I think this is exaggerating, just a _little_ bit!

> Its like running a Program on a 500khz machine, far to slow, may be OK for
> those with small 30meg hard drives..

Well, I use it to scan about 600 megs of hard disk space, from time to
time, and find it reasonably fast (as long as you're not scanning for
text _inside_ the files). Even when I'm using my 8 MHz system.

> Just wait untill Danny places Jetfind on Hensa, it will blow you away....

Actually, I have seen JetFind, and it didn't blow me away. Unlike
STree, with JetFind you can't _do_ anything with the files you've
found. No copy/move/delete/rename/view/print. So it's less useful
for me. YMMV. JetFind is also not _that_ much faster than STree,
either. About 30%, if I recall my benchmarks correctly. This was
version 1.3 something IIRC, so it may have improved.

Note that I'm not knocking JetFind. It's well done (although limited
in a number of respects), and very fast. It's been a while since I
was playing with my batch of file finders, but as I recall, JetFind
was about the fastest of the bunch (approaching the theoretical limit
of how fast the directory tree could be searched). I think the only
one I found that was faster was a prototype I developed in-house at
Paradigm (roughly twice as fast as JetFind).

A deficiency that both share (hopefully Ewout's will be better) is
that once you start a search, you're locked out, with very little
useful feedback. Neither shows you how many matches have been
found, or a list of the matches, until they finish. And you can't

stop them part way through if you realize you've specified a wider
(or incorrect) search than you'd prefer. File finders on the Mac
are _way_ better in this regard.

Yves,
I flipped the dipswitch #1 down, and on booting up the AHDI
(version3.01) answers: ''ASCI-DEVICE UNIT #1: IDENTIFICATION
UNAVAILABLE''.
For me, that means (I guess): the system has indeed recocnized SOMETHING
on that DMA-channel; only the device-name is not found (i.g Apple CD
ROM-idebtification). But apparently our driversoftware isn't capable of
speaking tot the connected device. We used the offial
Atari-CDROM-drivers and used MetaDOS 2.40 to run them.
```

regards,
Marc Laan

I quite agree. However the PC Unix world is Linux mad AFAICT. Who knows
why?

> How difficult would it be to port BSD 4.4 onto an Atari platform? I
> see (from comp.unix.bsd) that it has already been ported to 680x0

Its a question of writing the drivers. The main 680x0 based kernal should
compile onto the TT or Falcon with little difficulty.

It might be possible to canabalise some of the Atari Linux/68K drivers for
Atari BSD/68K (there - I've named it out loud! Bound to start a rumour).

Quite beyond me though.

Roland.

6462. Cursor keys in TOSWIN, tcsh and Elvis 1.7

Newsgroup: comp.sys.atari.st.tech
Date: 1994-11-30 12:26:00 UTC
From: sanders@sci.kun.nl
Message-ID: <D02yJD.Gp8@sci.kun.nl>
Source record: 28743

(This is a repost -- my nn died under my hands while sending this article. I couldn't see if it was really posted, so if this is duplicate, here are my apologies)

Hi,

Could anybody give me any information about my cursor keys malfunctioning (as in *not* functioning) in a TOSWIN window under MiNT 1.12 and MultiTOS? They won't work in Elvis, nor in tcsh itself. I have set term to tw52, and tried et52 and even st52. I can remember having had this problem long ago on my ST, but since it was solved I forgot how, and now I'm trying to set up my Falcon and I stumbled upon these same problems.

Now what I remember is that I had to do something with termcap. I still have my old one in /etc, but TOSWIN makes a $TERMCAP environment variable containing the whole lot -- except for the modifications. I can't remember whether I had to switch this off in TOSWIN. To be short -- I haven't got a clue and I'm getting pretty frustrated.

Same thing in MINIWIN, btw, so I doubt it's TOSWIN that's the problem.

Thanks *a lot* for any hints,
--

The program doesn't put *itself* in the background. It lets the shell,
or whatever is starting it, worry about what "background" means and
how to achieve it.

The question was if there was any support in the "multi_evnt" handler in multitos for this. Can you wake the process doing a multi_evnt by sending a signal, using a pipe etc. It appears not to be so.

It seems that we have a multitasking AES that doesn't support tos programs/processes. One solution to the problem would be to make the multi_event call with a small timer value, and constantly check if there was any messages, (pipes, signals updating a global variable etc), but this of course would not be a solution to the original question.

We will just have to wait for a new version of multitos and hope that it will implement AES messages thru MiNT pipes. Thanks for all the replys.

>I might be an idea to have a list of possible new features for MiNT-

>- key to refresh screen for when applications crash or don't work properly

That would be an aes feature not one of MiNT, but yes it would be useful. I wrote a program to redraw the screen and turn on the mouse pointer which I then installed on a function key from the desktop.

>- fix so that the last two clusters on a disk can be used (it would probably
>be safer to have it built-in reather than relying on an external program -
>also who wants a folder full of fixes

The problem is that this is filesystem specific, and so shouldn't be included in the kernel. If and when someone writes a tos xfs driver for MiNT so we don't have to rely on the rom code this will be fixed (isn't it fixed anyway on the falcon?)

- speaking of which what fixes do you
>need with MiNT, and which ones don't you need (Ste 1.6)
>poolfix4,shelfix,aespath,copyfix?

You don't need poolfix4, you don't need copyfix - and nor do you without mint as you have a new enough tos version. aespath is not needed with MultiTOS but isn't affected by just the mint kernel. I can't remember what shelfix does, I don't think you need it though.

>- ability to alter window names by clicking on them - this would be a fast way
>to change path if you were looking at a directory tree or even if you were
>using a word processor.

Again this is an AES thing; I can see the point in this, but it would need applications to know about it.

>Finally again, where should MINTNP, GEM.PRG (or should I use INIT =
>G:\mint\gem.sys),

I would use GEM=g:\mint\gem.sys

>NVDI, XAES, WINX go in the Auto folder

I don't think it matters, probably mint ought to go first, although it works fine if it isn't (just that anything run first isn't recognised as a process).

> - and does anyone think installing PowerDOS is worth it?

Not as well as mint, it's an inferior system offering some of the facilities of mint. Also, isn't it by a Hollis? Having read some of their postings on the

gem-list I wouldn't trust any program by them.

Really? So all the GEM applications run under multitos, magic or geneva have sn apid of 0? That must be very confusing :)

Of course, under MultiTOS no user programs will have 0 apid (I think the desktop does, but I'm not sure, it may be screen). So that method doesn't work.

It is a multi-tasking extension for your Atari. In the PD form it allows you
to run one GEM program at the same time as any number of TOS programs.

In the commerical form it allows you to run any number (limited by memory) of
GEM programs at the same time.

It also allows some other extensions, like loadable file systems, SLIP
communication, and even X windows.

You need to use the Minix FileSystem under MiNT to do this without changing
operating system to Linux or Minix. Its quite easy to install, but is not
much use without a harddrive. You can have names upto 128 characters long.
Its generally faster than the standard DOS system.

The Minix FS and MiNT can be found at all good FTP sites. This is a big step
just to have longer filenames though, as it requires reformatting the partition you want o
have longer filenames on and you must use MiNT to access that
partition. Also, the boot partition must be a GEM partition.

I don't know... Normally you should NOT get a negative value.
A negative value means that something went wrong, and that your
GEM-program should be terminated....

Migraph here in the US makes a very nice scanner product for the Falcon. It works very well in the true color mode as well. I'm not sure who is handling their software in the UK though.

There's a spot where the LCD connector plugs in, but it's treated just like a standard Atari Mono Monitor.

> i believe the stacy can also drive an atari monitor?

There is a monitor port on the back of the Stacy. If you plug in a mono monitor, then the Stacy will drive both the LCD and the mono monitor. If you plug in a color monitor, then the LCD will blank out and just the color monitor will function.

Most Ataries suffer from Dirty Contacts with the IC sockets, so just remove and re-insert all pluggable IC's..

The Larger PLC had problems with the sockets, they would crack, it was not untill the last batch of STE's that Atari changed the Brand of Socket..

Atari did fit clips first to stop the IC's getting loose, then added a clamp to stop the sockets from cracking...

If you don't have a PLC puller use a very small screw driver, and carfully lift out PLC IC...

Name *ONE* program that will run under Linux/x86 and Lines/68k, but not
under ANY other Unix. That's the whole POINT of Linux: to be a free Unix
clone.

The only reason I use Linux is that I like its politics better than the
politics of Free BSD. (Linux is a completely open development, while
BSD is a closed development)

I was never much of a fan of the PC, but its unfair IMO to criticise Linux
because it runs on the PC. I'm not much of a Linux fan either - but there
has to be a lot said for piggybacking Unix development for the Atari on
the back of a more active userbase (PC owners). Let them do the work and
we'll reap the rewards!

It will benefit BSD (if we every get it) and MiNT as well, as much of the
code will be easily portable to these OS also.

Roland.

: What's wrong with just letting the cron program run in the background
: without a controlling terminal? Do you need to use fork()?

Great! Thanks for the tip.

However, I still get a bus error. I've norrowed the problem down into
a small prog :-

```
-----------------
/* fork problem demo */

/* it seems that if the parent goes away before the child, we get a
bus error. Using just fork doesn't demo this problem because the
mint fork blocks. */

/* I'm using mint 1.12, gcc 2.5.8 - can't find the version no of the libs,
but I'm sure it is up-to-date */

#include <stdio.h>

main()
{

switch (tfork())
{
case -1: printf("Fork Failed\n");
break;
case 0: printf("Child\n");
sleep(100);
break;
default: printf("Parent\n");
break;
}
}
-----------------
```

(I compiled is with simply gcc -o a a.c)

I don't see that I'm doing anything wrong here... Interestingly, if I stick
with fork and get 2 process running (the parent is waiting and the child
is sleeping) - from the command line I can kill off the parent without
any ill effects.

Also, I had a binary crond on my system for some time which was working okay.
At one point I upgraded MiNT and I got these bus errors.

So I think that MiNT itself has this bug where the parent cannot die before
the child ....

Any ideas? Can anyone compile up the above prog to confirm this?

Many thanks,

Pete

Hi !

Does anyone knows how to save time after turning
computer off (hardware solution) ?
I've haded instructions how to do this through
the ROM modul port (but the electronic
components - especially CMOS MSM5832 has not
been abled to me (MSM5832 is a clock chip)...
If someone wants , i may send him this instructions
in a file (actually in a picture file) ..
So what's bothering me ?
I'll be very grateful if someone could tell me or
explain me how could i do this 'time saving' ?
I'm calling all the good guys who made the
circuit scheme for this by himselves, if
they could e-mail me the schemes (i know i'm asking
much ...)
Or, at least, give me some hints about that ...

Gratefully,

Neven

P.S. I'm seeking ONLY hardware solutions and possible
circuit schemes ...

6495. Corrupt downloads

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-01 13:29:28 UTC
From: julian@loose.apana.org.au
Message-ID: <3bkj3o$bh6@loose.apana.org.au>
Source record: 28777

I am having an intermittent but frequent problem with downloading a file and getting more bytes in it than there should be. Usually about 100 or 200 more.

I have tried different modems, different protocols eg: z y or x modem, sometimes when one stuffs it up, the other works.

I am using an STE with 4meg of ram, FreezeDriedTerminal, 9600 or 14.4 modems.

I did have 2 meg of ram but 6 months ago I got 2 extra meg from a friend who was going to throw them out as they were sometimes playin up in his DX66 PC. I have had no trouble with them.

Could faulty ram cause this? Obviously I can remove them and try it but I would prefer not to.

Any ideas? Thanks, Julian.

From: life@kuai.se
Message-ID: <3bkk5s$loc@nic.tip.net>
Source record: 28776

Hello!
I have an Atari 1040 STFM with a faulty drive. Now, i must replace drive
and i'm wondering of i can put in a IBM-PC drive into it. 1.44Mb?

How do i do??

/ Jonathan

6497. Re: Atari ST does not work...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-01 14:40:59 UTC
From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.45.0009AF2A@cfcsc.dnd.ca>
Source record: 28790

>My Atari ST upgraded to 1 meg a few years ago does not boot up at all.
>My monitor and disk drive are both on but does not work. Does any one
>know what might be the problem?

When you say your disk drive works, I assume the light comes on, if so, can you hear the floppy being accessed? I had a problem when I installed my 4Meg RAM in my STe. The RAM chips were not in quite right, and so my STe would not do anything. Perhaps your RAM chips have worked loose. I would suggest opening up your ST and reseating or pressing down on all your chips(not just the RAMchip upgrade) to make sure they are all seated correctly. BTW how was your upgrade down, soldering RAM on top of existing RAM, or a RAM board? This is similar to lifting and dropping the ST to reseat chips.
Anybody out there have anything to add, or correct?
Merci.thanks
-ken

6498. Re: Help: MiNT & Papyrus

>I have been told that I also need it to stop memory problems with adding extra
>colour icons
>under TOS 4.04. Is this true?

>If so, where can I get FOLDERnnn - I haven't seen it on any of the FTP sites....

>Anthony Jacques

If you use ICD, you can increase the number of folders you reserve for using
HDUTIL where you set up the ICDBOOT.SYS boot file. If you don't use ICD boot
look for a file called "FIX..." or "PACKAGE3..." or "PATCH..." at ftp sites.
Package3 I know contains just about every fix you could imagine, most of which
you won't need, and includes the Foldernnn.prg. Bonne Chance
Thanks/Merci

6499. Re: BSD 4.4 or Linux

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-01 15:10:19 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3bkp0r$i5t@whitbeck.ncl.ac.uk>
Source record: 28778

In article <3bj3uh$4he@uqcspe.cs.uq.oz.au>, warwick@cs.uq.oz.au (Warwick Allison) writes:
>Craig Graham <Craig.Graham@ncl.ac.uk> writes:
>
>>The justification for porting Linux as opposed to BSD is that Linux is
>>the de-facto standard for PC free Unix. That isn't to say it's the
>>best, it's just the most widely used. This means that there is a shit
>>load of new stuff coming every week for linuxPC, and most of it has
>>source distributions. 68K linux will give access to this large
>>software base.
>
>Name *ONE* program that will run under Linux/x86 and Lines/68k, but not
>under ANY other Unix. That's the whole POINT of Linux: to be a free Unix
>clone.

On a PC platform, there are several - I'll point to the ones I have used.

Alliance - a real heavy weight ASIC design system. The only PC unix supported
is Linux.

VXP - a clone of visual basic, but for developing OSF Motif applications in C.
Available in binary form only, and the only PC binary is for linux.

Many others exist, and the Linux dev newsgroups are always humming. I'm
not saying BSD isn't good (it is) but as I said in my original post, Linus
is happy to integrate patches from the 68K linux port into the main source
tree, which can only be a good thing as it means that once the port is
up & fairly stable, Atari & Amiga users will be able to influence to a
certain extent the progress of the rest of linux (any groovy patches can
be shared with PC users as well) - and possibly become official. There is
no way the BSD folks would accept patches from our motley crew is there?

Besides, why should we want BSD if we have Linux anyway. If we have a standard
portable free unix on the Atari, then rather than divide up the already thin
user base into BSD & Linux heads, we should stick to the one system (all
freinds together). And that one system should be Linux simply because it's
already been done whereas BSD is just a topic of conjecture (there is no
Atari BSD, and no-one is doing a port).

>The only reason I use Linux is that I like its politics better than the
>politics of Free BSD. (Linux is a completely open development, while
>BSD is a closed development)

Well, thats one reason. Another is that (at least here in the UK) there
is much more support for Linux. Case in point - here at Newcastle Uni,
I wanted to get a SLIP connection into the internet via MiNT NET. The
college couldn't help beyond giving me the line as they only provide support

to Windows or Linux users.

Many of my friends have installed Linux simply because it does such a good job. It's stable enough to use on an everyday basis. In fact, at work (Matra Marconi Space Systems (UK)) several departments have started installing Linux simple to provide extra X terminals to access our Sparc20's, as Linux is free & X server software costs $$$ on a PC (and actually isn't as effective as running Linux anyway).

Oh yeah, thanks for the mail /Hendr!K/, I quote you now:

>>It was announced on the Linux68K mailing list that a stable X server for
>>Atari Linux is now running real well in mono, and colour is being performance
>>tweeked at the moment. We are told to expect the first general release in

>X11R6 ran on a TT in TT-High and it looked nice. Bjoern and the guys have the
>ACSI-drivers ready and now they're working on an installation-programme.

So, not just an X11R5 server for Atari Linux, but a Dog's Genitalia X11R6 server. Fun Fun Fun......

Craig.

OK, sorry. Linux is a lot of separate hacks made by lots of people in
a more or less uncontrolled way :-)

How many versions of Linux are available?

>What is the difference between the two and for 1.12 on an early STe (1.06),
>which should I be running?

Doesn't matter on a cpu <68030, as these have no PMMU. Otherwise the 'np'
will disable memory protection on TTs, Falcons and PAK68/3s running the
original AES in ROM, which is not re-entrant.

Peter Lord <plord@novell.co.uk> wrote:
[in regard to difficulties in getting a background process running]

> switch (tfork())

Here's your problem: the syntax for tfork() is
long tfork(int (*func)(long), long arg)

The first parameter to tfork() is a function which will be executed in
the background; the second parameter is a long argument for the function.

In other words: tfork() is not fork().

(See the file "thread.c" in the MiNT library source for more details.)

6504. RESULT: comp.sys.atari.programmer passes 193:35

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-01 20:12:06 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.sys.atari.programmer-RESULT@uunet.uu.net>
Source record: 28781
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.atari.st,comp.sys.atari.st.tech

RESULT
unmoderated group comp.sys.atari.programmer passes 193:35

There were 193 YES votes and 35 NO votes, for a total of 228 valid votes.
There was 1 abstain and 1 invalid ballot.

For group passage, YES votes must be at least 2/3 of all valid (YES and NO)
votes. There also must be at least 100 more YES votes than NO votes.

There is a five day discussion period after these results are posted. If no
serious allegations of voting irregularities are raised, the moderator of
news.announce.newgroups will create the group shortly thereafter.

Newsgroups line:
comp.sys.atari.programmer Programming on the Atari computer.

This vote is being conducted by a neutral third party. For voting
questions only contact rdippold@qualcomm.com. For questions about the
proposed group contact Yat Siu <ysiu@lexicor.com>

CHARTER

Summary: a newsgroup for the discussion of programming on the atari
TOS or 8bit computer and any clones or otherwise

The proposed group will provide a forum for the discussion of
programming queries, discussions of techniques or anything else that is
related to programming on the atari for any language that exist on the
atari (scheme, gcc, c, basic, pascal, assembler etc.)

Justification:

There are currently several comp.sys.atari.* newsgroups, however
none cover the aspect of programming questions. Atari Computer systems
(8bit, 16 or 32bit and clones) have various development tools from other
third party developers, some of which are very good. Atari Users require
a forum where they can ask questions about programming in any language.

This new newsgroup is also meant to encourage programming on the
atari and asking questions regarding programming. Very often programming
questions are asked in other forums, but they either don't get a reply or
ignored because it is not related to the topic. Atari Computers have got
a user base of programmers who need to support each other on the usenet on
a more global scale, and it should also help third party developers for
atari development tools read and see what programmers use/require/want.

comp.sys.atari.programmer Final Vote Ack

Voted Yes

6505. MagiC and ICD FAST hard drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-01 20:29:13 UTC
From: W K Hon <zd381@city.ac.uk>
Message-ID: <Pine.SOL.3.91.941201201440.1921F-100000@burngullow>
Source record: 28783

(Please forgive me if this posts twice, I'm completely new to all this
and something went very wrong the first time I tried to post this)

I have a problem which I am told is due to my hard disk driver being out
of date. Has anyone come across similar problem in this context, is it true
and if so please, please could you tell me how I can get an up to date driver?
The supplier of my hard disk, First Choice Computers in Leeds, England,
have been pretty unhelpful to say the least, and they are not willing
to sell me a new driver even though they must have the latest version
with the FAST drives they are continuing to sell!

In January I bought FAST hard drive for my Atari STFM (4Meg, TOS 2.06
upgraded). The driver is ICDBOOT v 6.2.4 (1993)

I recently got the multitasking program MagiC v 2.01. Had trouble
getting it to work - wouldn't work at all, finally deleted the MAGX.INF
file out of desperation and got something to happen (although it
recognised some - not all - partitions as RAMdisks rather than hard drive
partitions!); managed to multitask a few programs, seemed to work OK.
Saved new INF file, tried to edit it insert some of missing lines from
the default INF file, MagiC wouldn't load at all using the edited
version. Back to new unedited version, it worked (but won't of
course allow me access to many features of MagiC because of missing lines
in the INF file!).

Contacted my MagiC supplier, Atari Workshop/System Solutions. They said
it was a coincidence/luck that I managed to get anything to happen by
trying to load it without any INF file at all, but particularly as some
partitions treated as RAMdisks, it must be due to out of date driver.
They also said it was risky to continue to try to use MagiC in the
circumstances I mentioned. Having had no luck with my hard drive
supplier, I'm uncertain what to do next. I don't want to pay 50 pounds
for ICD Professional Utilities just to get the new driver (which might not
even do the trick at that, I just don't know). I'm more than happy to
pay for just the driver, if anyone will sell me it. Does anyone have any
thoughts on whether it really is the driver which is the problem, if not
any possible solutions?

Can anyone please help me or suggest someone who could? I'm rather at my
wit's end now in relation to this, and I'd really appreciate an answer
in the next 2 weeks if possible as I only have
access to this Internet account through a course, which finishes in 2
weeks! My Email address is zd381@city.ac.uk.

Many thanks

Kuan Hon

Is that surprising to you? Is the PC community wel known for selecting
good OS's, or even applications, as 'standard'?! Do I have to mention
Windows, DOS, Word Perfect.....

Just couldn't resist this:-)

> break;
> }
> }
```

tfork() takes two arguments, a pointer to a function and an argument to
that function. But be carefull, the newly started thread gets only some
very small stack by default (4 or 8 KB, IIRC).

```
/*
* unistd.h is merely a guess, tfork() might
* well be declared elsewhere (support.h?)
*/
#include <unistd.h>
#include <stdio.h>

int foo (long);

void
main ()
{
tfork(foo, 123);
printf("thread1\n");
_exit(0);
}

int
foo (long arg)
{
printf("thread2: argument=%ld\n", arg);
sleep(5); /* thread1 exits before thread2 */
exit(0);
```

```
}
```

6510. HD floppy/TT/Spectre questions

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-01 23:23:32 UTC
From: paul@vega.ame.arizona.edu
Message-ID: <3blltk$rnm@news.CCIT.Arizona.EDU>
Source record: 28786

I'm thinking of getting a high-density floopy for my TT. I'm running TOS 3.05, which can handle HDs, and even format them (though not standard, I understand). I have heard, I think, that some TT's could be upgraded without putting in the 'AJAX' chip (I got my TT just before they came with HD drives). Is this true? I guess I could just put one in and try it.

Also, what is the AJAX? Does it has an 'official' number or something? Can I get it at a local electronics place, or would I have to order it? Is it a pain to put in (soldering), or does it just plug in?

As I recall, to get Spectre GCR to work with a HD drive, there needs to be come chip replaced in it. Could someone tell me about that (I really doubt I'd be able to get any information out of Dave Small).

Finally (though I know the whole thing is just a dream), does any one know if the supposed Spectre 3.1 can handle high-density disks?

>OK, sorry. Linux is a lot of separate hacks made by lots of people in
>a more or less uncontrolled way :-)

>How many versions of Linux are available?

Is this an urban legend or what?

The current version of Linux is 1.1.64 (actually, 65 or 66 may be out by
now - new versions are available every week or so, for those who want the
bleeding edge).

Personally, I started with 1.1.19, then moved to 1.1.54 because I wanted
soundcard support (I simply recompiled the whole thing - it was easier
than grabbing binaries!).

As for `uncontrolled', this is bogus too. Linux development is all
centred around Linus Torvalds. Even patch effectively comes from him,
from his system. It is `uncontrolled' in that you don't need any special
license of permission of NDA to work on the OS, but when it comes down
to actually changing anything, `hacks' have to be channelled through
a system that is much more discerning than, say, the MiNT patch process.

Anyone who really wants to know about Linux can go find out - it's no
secret society. Telling tall stories just shows how little you know.

To see FASTTEXT in action (if its in the binaries - nope, doesn't seem to
be - recompile or just get vconsoles - its better anyway!) use QINDEX.
Usually, you can't get the text scroll benchmark past 100% since it tests
text-based GEMDOS text scrolling. It goes to well over 1200% on my
machin e(haven't tested recently)..

: Mathew

Eh ... well actually, my problem is connected with running crond on
recent MiNT versions - I need to run this from mint.cnf. So the
program needs to put itself in the background (no shell in sight ...).
This is the "normal" UNIX way of running a daemon.

Using fork used to work fine ... until I updated MiNT (I think 0.95 used
to work as expected).

I reckon the time might be better spent integrating VM into MiNT. After all, MiNT is fast, requires less hardware and currently does a very good job of being BSD-like. VM and the non-blocking fork are the only major differences, really, and MiNT also runs TOS programs. This kind of "advanced MiNT" MiNT would also allow 68000 users to at least run the programs, albeit without VM and memory protection. Why duplicate work?

From: matt@plab.dmll.cornell.edu
Message-ID: <3bn42e$7q6@newsstand.cit.cornell.edu>
Source record: 28693

I just stumbled upon a (basically) freebie 520ST, and I'm trying to rebuild it into a semi-useful machine. I've read the FAQ and had some luck digging for hardware hacking info, but I haven't found out much about the DMA port yet, other than the pinout given in the manual.

What sort of hard drives were originally offered by Atari? I'd assume MFM, given the date and price point. I have an old 20MB ISA (pc) Hardcard, which has and MFM drive. The pinout of the DMA connector suggests that it wouldn't be too hard to get an 8-bit ISA MFM controller functioning w. it. Does anybody know about such a possibility?

While I'm on the topic, the floppy drive I got is of the SSDD variety. The drive mechanism appears similar to a PC's 3.5" floppy, so I'm wondering if I couldn't use one to get DSDD working. Eh?

The shell doesn't have to "know" or "guess". You tell it. I tell my
shell to do it by adding "&" to the end of the command. So, to start
the cron daemon in the background, I would type

crond &

Mathew

funny to hear you say that. Don't forget that the whole MiNT project is
nothing but a huge effort to duplicate UNIX and let it run on an Atari.

Mint will not do any contextswitches if you are in supervisor mode.
So, in an interrupt you won't be thrown out. At least not in the
current version of mint.

Wrong.

ACC's are called with a pointer to the basepage in register a0.
Programs are called with a blanked out a0. Additionally, an acc's
PARENT basepage must be 0.

This test even works in the auto-folder, and is the one to use.
(Used in the startup code in the mint-library, have a look at
crt0.cpp, crtinit.c).

You may by accident have changed the switch "parallel port access" from
"directly (background)" to "via TOS". When printing via TOS the print
dialog is modal because this can't be done in background.

>about the DMA port yet, other than the pinout given in the manual.

Ataries DMS port was developed around the pre SCSI standard SASI
from memory, so the best way is to get a SCSI host adapter, their
are IDE one but they are German and have very bad support...

Atari use MFM/RLL drives with SCSI to MFM/RLL adapters..

>While I'm on the topic, the floppy drive I got is of the SSDD variety.
>The drive mechanism appears similar to a PC's 3.5" floppy, so I'm
>wondering if I couldn't use one to get DSDD working. Eh?

Their can be problems with a lot of OEM disk drives, Teac seems to be the
prefered brand here, the problem is with media change, Atari uses the Write
protect to indicate a disk change, but this does no allways work with some
brand of drives...

Some Atari machines and external drives have adapter boards fitted to
SSDD drives, some you can just remove this board and some you can't, also the
leads can be to short, this can be a BIG problem if you don't know what you are
doing....

Well someone out there has done an X port. I can't remember the address off hand, but it needs MiNT, MiNTnet, and 4 Megs (at least). Unfortunately it is huge, and IIRC on a 4 Meg ST you only get 600K free... time to find a nice 8 Meg board I think!

Hallo!

Could anybody please give me a hint, how I might contact Volker Soehnitz, the author of a virus detector on the Atari ST? I tried "normal" mail and email using the following address:

volker_soehnitz@ac.maus.de

I think that my mail has reached its destination, because I did not get it back, but I never managed to get an answer.

Thanks in advance.

Andreas

6532. FPUs in Falcon

>>while newer ones have them nailed to the floor ..erm.. surface mounted.
>
>Well you haven't seen all boards then. Its definitely PGA (Pin Grid

How can I say such wrong things???. I apologize - I'm shocked that my memory is just getting too crowded with facts for me to completely trust it. The Falcon's aren't PGA, they are PLCC (the wrap-around-the-sides pins - Plastic leaded chip carrier)

>Array - the bed of nails out the bottom of the chip.) I've seen two
>falcons with that chip carrier. Wayne

Well I was right about there being two falcons anyway - just wrong about them having PGAs - they both had PLCCs for the FPU. I'll double check those facts next time I respond.

My apologies to Peter for sounding so rigtheous - and doubting him in the first place. His information has always been spot on before. I did think I knew what I was talking about since it had only been a couple of weeks earlier that I had opened half a dozen machines to see what FPUs they needed. My Mega SST needed PGA - not the Falcons. (Sure glad this all happened before I went out and bought more PGA FPUs - or there would be one heck of a fire sale going on right about now.) Humbly spitting out black feathers, Wayne

I put my MiNT port of GNU make 3.71 on Simon's incoming area yesterday
(and downloaded gcc 2.6.1, too).

>In C++ the CursesW class is unimplemented because I don't have a
>cplusplus aware curses.h file. The source is included in gcc161a.zoo.

Funny, the curses.h I've got has extern "C" { } wrappers around it, or
do you mean something else?

>GCC 2.6 uses two new builtin functions for allocating and deleting arrays
>these two functions are in op_vnew.c, which should be compiled and added
>to gnu.olb or mint.olb. You will find this file in gcc261a.zoo

Hopefully entropy will add something that works-alike to the next
MiNTlibs (since AFAIK MiNTlibs is trying to be GNU-free internally).

Stupid, I know, leaving the power on while poking around inside.
Anyway, the damage is done, and my power supply instantly shorts its
fuse when switched on.
Nothing is visibly damaged, which makes things more frustrating
when it comes to trying to fix it.

Does anybody have any ideas of how to repair it ?

If not, can anybody recommend a cheap source for a replacement
(short of buying a complete ST) ?

Thanks for any help,

Steve.

It wouldn't fit into the case. You'll have to change to a tower-case.

> If so what is the performance/compatibility like?

There are no compatibility problems with software, which is written
processor-independent. It's the same as with a TT. For games, of course,
the speed itself is a compatibility problem.

6538. The dream atari...

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-04 09:14:48 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELEVEIUSUp@stingray.manawatu.gen.nz>
Source record: 28718
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

OK here goes...

Imagine we as members of comp.sys.atari.st[.tech] are designing the new Atari range.

What would you want in it??? (No going "interstellar" in your ideas here - let's just see what we could come up with ok?)

First of all... _No_ 2 1/2" internal drive as these don't give as much room or speed as 3 1/2" ones.

A decent resolution - 1024X768 in _colour_ would be fine. And continuing to have screen memory _anywhere_ in memory and not just on a graphics board like those _other_ computers we Atarians love to hate =8-]

I think we should have _pull down_ menus as those "crash-down" ones are somewhat annoying (doesn't everyone agree???)

An '040 or '060 as '030s are just too old. And at least 50 Mhz ???
A DSP to do all the "extra-work", and of course decent sound - stereo, with good A-D/D-A converters with decent s/n ratios.

1.44 internal drive, and HDD as standard (say 540M or so?)

A _separate_ keyboard - with keys that don't feel like a sponge (like my 1040STfm)

The ability to have scroll registers so that hardware scrolling can be done without having to resort to time-consuming software implementations - remember the old 8-bit atari and how easy it was to scroll the screen???

Decent horizontal blank interrupts (like the 8 bit atari!!!) that let you swap palettes... (although a large palette to start with would be nice).

Multi-tasking doesn't seem to be too way out these days and it would be nice if we could get rid of the 8+3 filenaming convention - lets have longer filenames - and perhaps add a bit to remain compatible with previous disks...

Well that for a start seems ok - what do _you_ all think???

Maybe if we suggest a few decent (and not too wayout) ideas, someone might listen that can do something about it???

Who knows?

I love Atari, and really don't want to have to buy a PC - but without some1 prepared to make a _new_ atari, what's the point???

In hoping that this will start a thread...
Richard =8-]

PS. (For Roger Sheppard) This is just a bunch of ideas, so please don't go decrying a really nice idea ok?

The UW server. It uses networking calls that weren't implemented in
Linux. FYI, UW is a way of getting multiple windows off of one terminal
connection to a UNIX box... works great under BSD UNIX and a bunch of
others, and has a GUI client for the ST. Drawbacks are that it
implements an adm31 terminal (ICK!) and xmodem and kermit for downloads.

True, a SLIP connection would be more effective and flexible, but UW is
very, very simple to set up.

>The only reason I use Linux is that I like its politics better than the
>politics of Free BSD. (Linux is a completely open development, while
>BSD is a closed development)

That's true. Drivers seem to appear quicker for Linux than _any_ other
operating system (even DOS!), too.

6543. Replacing the MultiTOS shell?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-04 16:53:22 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <786560002snz@bigbox.demon.co.uk>
Source record: 28727

Can anyone help me out with some questions on the MultiTOS shell? I know that you can set the name of a program to be used as the MultiTOS desktop using the shell command in the gem.cnf file. This program is the program who's desktop appears by default when using an application that doesn't install its own. But if I want to have a login program to run first and then run a desktop named in the user's preference file then the login program's desktop (empty) is treated as default. Is there anyway of telling MultiTOS to change the default desktop?

Let's have QUALITY audio in/out ports WITHOUT bass boost. (If I wanted the
bass boosted, I'd adjust it on my amplifier, thank you very much.) How
about more than just left/right stereo? Maybe 4 or 8 or even 16 ins/outs
(optional, perhaps?) for those with a musical interest?

>1.44 internal drive, and HDD as standard (say 540M or so?)

TWO internal 1.44 drives, PLEASE!

>A _separate_ keyboard - with keys that don't feel like a sponge (like my

And a REAL mouse, not this cheesy (pun intended) POS that Atari makes.

Also, lets finally SEE (and not just hear about) a notebook version. ANd
let's stop talking about products that won't be out for 18 months and then
are discontinued along the way because they're old news when they're finally
made available. In other words, the manufacturer should shit or get off
the pot.

Well, I've got a spiffy ExaByte 8200 (2Gb capacity) tape drive plugged into my Link2 and was drooling over the ability to exchange tar tapes with people using other Unices. I say 'was' because I seem to be missing something fundamental here. I have no device /dev/rmt0? for tar to read/write from! I've poked around and see now obvious clues about how to properly setup the device files with approriate major/minor numbers and for that matter don't know if I need a special tape driver!

Any clues out there?

Thanks!

I`m happy to say that you`re wrong! There really IS a port of X11R5 for
MiNT available. To use it you need a basic setup with MiNT and MiNTNet.
Lots of memory is probably also a Good Thing(tm). According to the
accompanying README-file there are a couple of known bugs, but for an
unexperienced X-user they don`t seem too awful.

I`ll try it out on my Falcon 14/2000 later. :-)

>Also, what is the AJAX? Does it has an 'official' number or something?
>Can I get it at a local electronics place, or would I have to order it?
>Is it a pain to put in (soldering), or does it just plug in?

Ajax is a DIL IC which replaces the WD1772 floppy drive controller. The
Ajax in my Falcon is marked C302096-001A.

You can get one from Best Electronics, in San Jose, phone, 0408 243 6950.

_If_ the WD1772 is in a socket, you can just take it out and plug Ajax in.

IIRC you also have to set one of the DIL switches (#7?) on for HD operation.
Apart from installing the HD drive, I'm not sure if any other mods are
required on the TT.

Some of the older STs require additional electronics to switch a 16MHz
clock to Ajax.

BTW, _some_ WD1772-02-02 work OK with HD drives.

A PowerPC processor (602 or 603).

>
>A decent resolution - 1024X768 in _colour_ would be fine. And continuing to
>have screen memory _anywhere_ in memory and not just on a graphics board like
>those _other_ computers we Atarians love to hate =8-]
Well, this can be a problem. Its REALLY hard to get very high resolution
video from a screen memory common to the computer's main RAM. It makes
the use of dual-ported VRAM impossible, which results in MUCH higher bus
loading for video traffic, limiting the available bandwidth for the
main CPU.

It certainly is CONVIENENT to the programmer to be able to allocate
screen memory anywhere in RAM, but will severely limit the possible
standard video resolutions or the CPU's throughput in higher resolution
modes.

>
>An '040 or '060 as '030s are just too old. And at least 50 Mhz ???
A PowerPC processor.

>
>A _separate_ keyboard - with keys that don't feel like a sponge (like my
>1040STfm)
Yes, this is the MAJOR reason I never bought a Falcon.

>
>The ability to have scroll registers so that hardware scrolling can be done
>without having to resort to time-consuming software implementations -
>remember the old 8-bit atari and how easy it was to scroll the screen???
Well, it was also trivial to scroll bands of the screen... in completely
DIFFERENT directions. But this seriously complicates using a "standard"
bit mapped graphics system like the AES/VDI that just does not include
the concept of discontigious displays and scrolling outside of windows.
A good hardware Blitter in the video/graphics system that could handle
not only quick scrolling (by moving data) in windows and over the whole
screen, as well as general graphics data movement/operations would be

much more useful (in my opinion) than just hardware scrolling registers.

>
>Multi-tasking doesn't seem to be too way out these days and it would be nice

>filenames - and perhaps add a bit to remain compatible with previous disks...
Multitasking and filenames are completely unrelated issues.

I've done multitasking on 8080 and Z80 based embedded systems that
didn't even HAVE a filesystem of any kind, but ran only preloaded
ROM based software.

>
>I love Atari, and really don't want to have to buy a PC - but without some1

Well... I'll probably be switching anyway to something PowerPC based.
Although I'd really like to see someone OTHER than Apple selling
them, before I have to commit my money.

Can anyone please tell me how to add a message to the file selector (e.g. "Select file to LOAD"), from TOS 1.02? I am using UIS 3, and have several proggies that use it, but have no idea how it is done.

If it's any help - I program in C, assembler, GFA Basic - so I should be able to configure any answer I get to suit one (or more) of the above.

Thanx,
Richard =8-]

I don`t know if you will be able to exchange tapes, but my GUESS is
that it will work. Better ask Erling Henanger (he`s on the net).

> I say 'was' because I seem to be missing
> something fundamental here. I have no device /dev/rmt0? for tar to
> read/write from!

I guess you are running MiNT? There`s no built-in support for tape-drives
in MiNT. As far as I know there are only two ways of accessing tape-drives
with an Atari. Either you use GEMAR, which is a GEM-version of tar with
built-in drivers that should be able to handle your drive. I don`t know how
well GEMAR works with MiNT/MTOS.

The other way, which I use myself with my Wangtek unit, is to grab the
scsi-drivers that Erling Henanger have written. They are probably available
as ehscsi04.tgz (or was it ehscsi05.tgz?) from atari.archive. Included is
a driver that gives you /dev/tape and a small program to control your
tape-unit (mount, unmount, rewind etc.). Works VERY well together with
GNU tar v1.11.2. If you want compression then just pipe the output through
GNU zip (tar -czf /dev/tape any-drive-that-needs-backup &).

> I've poked around and see now obvious clues about how to
> properly setup the device files with approriate major/minor numbers and
> for that matter don't know if I need a special tape driver!

The current version of Erling`s scsi-drivers is source-only, so you`ll
have to compile it yourself. Also, /dev/tape is hardcoded to SCSI ID#6.
The only real problem that I`ve had is when trying to skip a tar-archive
on the tape to get to the next. The skip-command doesn`t seem to work.
This can of course be circumvented by reading the whole tar-archive
(with f.e. tar -tzf /dev/tape). Apart from that it`s quite user-friendly!

Included in the package is also a CD-ROM driver that gives you raw
access to the disc. Haven`t tested it myself though since CD-tools works
very well for me.

GEMAR is ShareWare (quite expensive). Erling`s drivers are FreeWare IIRC.

For the Falcon, it works, but since you are describing a desktop model,
of course a 3.5" SCSIII drive would be mandatory. :)

>A decent resolution - 1024X768 in _colour_ would be fine. And continuing to
>have screen memory _anywhere_ in memory and not just on a graphics board like

Would require more and more main memory the higher the rez you go. I wouldn't
mind some sort of compromise.

>I think we should have _pull down_ menus as those "crash-down" ones are
>somewhat annoying (doesn't everyone agree???)

No. I prefer drop-downs over pop-down (Windows) and especially over those
finger-ruining mac strain-down :) menus.

>An '040 or '060 as '030s are just too old. And at least 50 Mhz ???

We've got those now...

>A _separate_ keyboard - with keys that don't feel like a sponge (like my
>1040STfm)

My falcon doesn't feel like a sponge. $10 for the TT touch and about an hour's
work and it's great!

>The ability to have scroll registers so that hardware scrolling can be done
>without having to resort to time-consuming software implementations -
>remember the old 8-bit atari and how easy it was to scroll the screen???

This is really only needed for games or ugly-Amiga-like "screens" junk. :)

>Decent horizontal blank interrupts (like the 8 bit atari!!!) that let you
>swap palettes... (although a large palette to start with would be nice).

With a true-color mode, you don't need this. this would only be a hack
useful for games and full-screen slideshow programs. I'd prefer software
to become more standard, running in a window, etc. If you want this hack,
get an Amiga and play with HAM. :)

>Multi-tasking doesn't seem to be too way out these days and it would be nice
>if we could get rid of the 8+3 filenaming convention - lets have longer
>filenames - and perhaps add a bit to remain compatible with previous disks...

MultiTOS works. 8 + 3 I have never had a complaint about, but if we switch,
make it UNIX-compatable. jsut say NO to mac filenames with spaces et all.

>Well that for a start seems ok - what do _you_ all think???

it's a pipe dream, and basically what most people want. :)

But cron is off course started from /etc/rc. Having a line `/sbin/crond &'
(or similar) in /etc/rc sure looks like an ugly kludge to me.

Michael Olin (molin@cxc1.cl.msu.edu) wrote:

: TWO internal 1.44 drives, PLEASE!

A better idea would be 2.88MB drives. Although I haven't used any
2.88MB disks, these drives are noticeably faster even with 1.44MB and 720KB
disks.

: And a REAL mouse, not this cheesy (pun intended) POS that Atari makes.

It's not so much the mouse that annoys me, but rather where you
plug the mouse in on the ST keyboard models (520ST, 1040ST, etc). You lift
up the keyboard and then spend forever trying to plug that thing in! I
now use a Mega STe and find it much nicer to work with.

As for the hardware innards themselves:

1) If I were going the RISC route, I'd choose a chip made by either
MIPS (Say an R8000), or a PowerPC. My only reservation about this is that
you would need a large hard drive (preferably SCSI) to keep all the
binaries. I tend to equate RISC with fatter binaries!

2) 24-bit graphics would be plus.

3) DSP!!! Improvements anyone?

As for software and GUI, I recommend taking a look at NeXTstep. From what
I've seen it looks impressive! Better still, I hear NeXT is working on a
GUI called OpenStep which is supposed to be pretty revolutionary. Atari
should take a look into that (if they were willing to put the time and
resources into a project of this magnitude).

: Also, lets finally SEE (and not just hear about) a notebook version.

That'd be impressive!

Hello,

I am looking to connecting a Hard Drive to my 1040STe. I have the ICD Advantage Plus ST Adaptor connected into the DMA port. I plan to purchase a Adaptac SCSI HD Controller and then a SCSI HD. Is there anything I'm missing here, or anything else I need (minus a decent case to house everything with a fan)? Are there special HD's I must use, or can I use just about any SCSI HD? Thanks for any help,

Theron

You don't need the Adaptec controler; the ADSCSI+ is able to control up
to 7 SCSI devices (I personnaly have two Quantum drives [LPS series] and
an Archive streamer). Just plug your SCSI drive and it will work.

MintNP.PRG requires an MPU, not an '030. The Falcon and TT have an MPU (
Memory Proccessing Unit). Memory protection and virtual memory both require an
MPU. I don't know if you can do both at the same time. I think there might be
problems, but Windows does it OK, so Mint should be fine too.

In my case no, the voltage on the primary cirquit is about 300V.
So there is another problem.

Well, the interupt must be run in usermode, to allow other interupt occur
during that interupt. Why? Because its a real fast modplayer.

Source record: 28645

I am trying to use the TUW-TCP/IP (from the University of Vienna) with Telnet and Ftp on my TT. I have the Riebel Card Plus installed.

I have the following problems:
The Telnet application does not run in TT-RAM.

If I try to transfer larger files using 'put' in FTP, I get the message 'Data connection closed' before I get the message 'Transfer completed'. Only parts of the file get transfered. The size varies.

Any ideas? Thanks,
Hans-Martin Krober

An Archimedes (ARM3 CPU) usually has around a 40-100Meg HD. The binaries
are on a par with Atari ones for size.

>>As for software and GUI, I recommend taking a look at NeXTstep. From what
>
>Take a look at RiscOS too. The GUI is better than NeXTstep one.

RiscOS is nice, and easy to use (check all the under 12's who use it in the
UK) but I wouldn't go as far as to say it's as good as NeXTstep - because
it just isn't. It lacks the integrated feel, and the raw power - in fact, until
the release that came with the RiscPC (ARM610 CPU), it could only use
up to 0.5Gig of drive space in total, making it totally unsuitable for large
scale uses - this was not a hardware problem as we have a lot of Acorn R260
workstations here running RiscIX (ARM Unix), just a flaw in the OS.

I have had a Falcon for sometime now. A while back I bought a Lattice C 5.5, But the version i got was the one without Falcon support (an old one). And since then I havent done any programming on it.

But know I feel the urge to start. Id like a programming suite/language whatever that will enable me to write programs that access the different aspects of the falcon, like sound and graphics. I would also like to make use of the dsp.

The best thing would be libs for gcc but I think that might not be avail, but can anyone recommed a language. (How good and what enhancments are there to the new Lattice, does it offer control over all graphics and sound.?)

Id also like a book like "beginners guide to dsp programming", and if needed " a beginners guide to the assembly langauge of the 56k " or something.

I do requirce more than a little booklet listing the command built into the 56K.

Thank you for taking the time to read this.

STOS does in fact work with the Falcon030. I used it alot on my TOS 4.04.
You can use my STOSFX27 program I wrote. Itcan be found on Delphi and on
GEnie. The interpreter does work well, but you have to follow the
instructions with the STOSFX27.
That keyboard problem does not happen with this fix. The fix that
ST Format released that calculated the values BASICMJH.PRG doesn't calculate
two of the values correctly on the Falcon030, and that is what causes the
keyboard problem.

6580. Connecting STs

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-06 08:42:58 UTC
From: uel035r2a@tferi4
Message-ID: <1994Dec6.094258@tferi4>
Source record: 28660

I have two STs: 520 and Mega2. I would like to connect these machines somehow, so that 520ST would run like a terminal and Mega 2 would do all the job for both. That connection would be only for experimenting, not for real work. I think Mega2 is too weak to be a workstation.

1. Is it possible to do it under MiNT?
If yes, how? RS232, MIDI, ...?

2. Can I run more GEM applications at once under MiNT? I have downloaded kernel and TOSwin and I can run only TOS programs.

3. If yes(2), can I run GEM application on "terminal" (=520ST), ie will I get the results on "terminal" screen?

Any HW and SW tips would be appreciated.
Thank you in advance

The hanging (not releasing the terminal) when logging out on console is a known problem. I don`t know about your halt-problem though. Try getting MH-MiNT 1.12h2, it fixes a couple of problems including the hanging.

While a PowerPC certainly would be nice, note that a PowerPC computer
which does not adhere to the PREP standard (or its successor) would
probably not be accepted by the marketplace. At least it would be
a difficult marketing feat.

> >A decent resolution - 1024X768 in _colour_ would be fine. And continuing to

I also think this is a bit of an illusion. The one thing I'd like to
see is a ultra-lowcost 3D graphics computer. 3D graphics need hardware
support to run at a bearable speed, but you could probably do a lot with a
selected set of graphics functions, without implementing the full
3D graphics pipeline. The PC world is currently about to enter the 3D
arena, with the first 3D graphics boards arriving, so it's not too
late yet.

No updates unfortunately but I'll post this once a month! - Mark
****
IMPORTANT NOTICE!!!!!!! IMPORTANT NOTICE!!!!!! READ THIS!!!!!!!!

As I will lose free Internet access soon (in about a month's time) and will
no longer be able to search and test endlessly all FTP sites any more, like
I have done so far, I will now hand this list over to Mark Smith in the UK,
so that it can be further updated and posted. I might be back on the net
later, and take over again (or do it in co-operation with Mark), but as of
now Mark Smith (msh@dl.ac.uk) will handle everything concerning this list.
So, write to him if you have any updates or new sites etc, and not me.
See ya!

Hallvard, Oslo, Norway

PS. Thanks to all for your encouragement and support!!
Good luck Mark!

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
--------------------------------
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
```

7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

6589. Compiling MiNT with LC

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-06 17:34:21 UTC
From: artoj@mits.mdata.fi
Message-ID: <3c27at$odc@prime.mdata.fi>
Source record: 28666

Is it possible to compile MiNT 1.12 with Lattice C (5.6) ? I tried, and managed to compile it after adding couple prototypes and declaring Fcntl function. But the binaries were huge, almost 300k compared to the original of about 160k. Is this normal? Also as I ran it, mouse didn't work very well. When I pushed a button, I had to move mouse before it reacted. Couldn't launch any programs either.
Yes, I used it with MultiTOS, and compiled it with -DMULTITOS flag.

6592. Can't del directory

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-06 17:37:36 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <12061994.173736@empyr.dircon.co.uk>
Source record: 28674

HI, I just created a directory called ' TREVORS.*** ' (well, that is what I typed in anyway, the directory appears as ' TREVORS.??? ')

If I try to open the directory, TOS says it can't find it, but if I click on OK, there it is !, a separate window for it !. Trouble is, I cannot delete the bloody thing. I created another dir called ' TREVORS ' (no extension this time), and the same thing is happening to that as well.

I'm using TOS 1.4 on a 1Mb 520STFM, with a 105Mb SCSI HD, using ICD 6.5.5 drivers. I created it whilst in Teradesk 1.40, but cannot delete it in either Teradesk or normal TOS.

Any ideas ???

VQWK 6.20 [Rev H - 04/04/94]

You don't have to run in user mode to allow interrupts. You can stay in
supervisor mode and change the interrupt mask with e.g. "and.w #$f9ff,sr".
That's in fact what I would recommend doing.

This remainds me, is there a moduleplayer which uses DSP and runs under MultiTOS? I've seen couple, but they are all based on Bitmaster's ugly code, which causes random keyclicks to come. Very annoying and makes working totally impossible.

6595. Guitar Distortion & DSP

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-06 18:46:44 UTC
From: artoj@mits.mdata.fi
Message-ID: <3c2bik$oi5@prime.mdata.fi>
Source record: 28671

Is there a program that makes guitar distortion? I mean, it could be possible
to make a distorter of quite good quality using the DSP, don't you think?
Is there any?

: Thanks..........

There is a basic program that comes with the ST basic disk that moves
a filled rectangle around the screen. has options to use or not to
use the blitter.
huge difference!

can't recall details - been a long time since I've used my ST for anything
other than music (C-Lab Creator).

Could someone direct me to a site where I can get instructions on how to setup the atari Linux (with the file list I need) or tell me what I need to do?

I do not have MiNT installed, however nothing in the ANNOUNCE files indicated that I needed it...

6601. NECROMUNDA DEMO by Paranoia

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-07 11:41:12 UTC
From: sdb3@aber.ac.uk
Message-ID: <3c470o$n4c@fileserv.aber.ac.uk>
Source record: 28680

NECROMUNDA, by Paranoia (a dedicated ST music demo) is now
available from Mickey Boyd at Florida State University
to download free on...
'atari.archive.umich.edu' in '/Demos/necromun.lzh.'.

It runs on any STFM/STE and includes stereo music where available.
(It runs best on machines with 1MByte or more)
Please join us in work on our next project.

6602. Re: CoNnect & F030 LAN Port

Source record: 28688

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
> Is it possible to get connect to use the Falcons LAN port?

Yes. Use the HSMODA04.LZH driver package, select SERIAL2 in Connect,
use it with "no" or "XON/XOFF" handshaking. Hardware-handshake will
work in the next release (the Mac-like CTS/DTR).

6603. Re: BSD 4.4 and Linux

Try RAPE_ME.ZIP (Rape the DSP), it came with FOG 7 (Falcon User Group disk
magazine).

Only problem with all those module players is that there are no good
modules :-)

From: fvdakker@sterbbs.nl
Message-ID: <32121XNIVWEQMRFTQYF@sterbbs.nl>
Source record: 28684

IN>I have two STs: 520 and Mega2. I would like to connect these
IN>machines somehow, so that 520ST would run like a terminal and Mega
IN>2 would do all the job for both. That connection would be only for
IN>experimenting, not for real work. I think Mega2 is too weak to be a
IN>workstation.
IN>
IN>1. Is it possible to do it under MiNT?
IN> If yes, how? RS232, MIDI, ...?

Yep, RS232 is the easies way, with a null-modem cable (NOT the cable
you use to connect with your modem!!!!)

IN>2. Can I run more GEM applications at once under MiNT? I have
IN>downloaded kernel
IN> and TOSwin and I can run only TOS programs.

Use MultiTOS, or another shell that can handle Multitasking

IN>3. If yes(2), can I run GEM application on "terminal" (=520ST), ie
IN>will I get the results on "terminal" screen?

Think so

IN>Any HW and SW tips would be appreciated.
IN>Thank you in advance

A Null-modem cable is an RS232-cable with the recieve and
transmit-pins swaped. Don't know wich pin that is, but there must be
someone here who does :-)
For software there are a lot possibilities; I'm now using STarCall and
I *really* like it. On Hensa you can find the German version; I'm
trying to get the engisch version there too, but haven't succeed yet
(some problems with my provider).

Has anyone heard of the Medusa which is apparently a cobbling together by a third party (Swiss I think) of bits and pieces of the Atari? I think this might be the 'dream Atari' you're looking for. I came across a short article on it a while back in ST Format (or some such magazine) - if I can find it I'll post more details.

Give me a pop-down menu any day.

6608. Xbios Setscreen() details

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-07 20:29:35 UTC
From: slh100@tower.york.ac.uk
Message-ID: <Pine.SGI.3.90.941207201250.20096C-100000@tower.york.ac.uk>
Source record: 28686

I have a couple of questions about using the Xbios Setscreen() function to implement page flipping in an (ST low resolution) arcade game I am writing. I have been told that I should synchronize my code with the vertical blank before switching screens, but it seems to work without this. Do I need to call Vsync() before Setscreen(), or am I ok without?

Also, I seem to rememver reading somewhere that Setscreen() can only display a block of memory whose address is a multiple of four. At the moment I am just using:

```
char *screen = malloc(32000);
Setscreen(x,x,-1);
```

and it seems to work. If it is true that Setscreen() requires an address on a 4-byte boundary, malloc must just always be returning suitable values, but it doesn't seem like a good idea to rely on this. Does anyone have any experience of this?

It is working on my 1040 STe without worrying about either of these issues, but I would like to know that I am not ignoring anything which may cause problems with other systems and TOS versions.

6609. Calling .ACCs without a menu bar

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-07 21:40:26 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELIKDCUSUp@stingray.manawatu.gen.nz>
Source record: 28689
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Is it possible to call an ACCessory without having to have a menu bar and everything set up first?

I have my own menus (which I will release when finished) and want to be able to show the .ACCs loaded - also how do I do that??? - and let the user select them.

Is this possible?

Any help would be most appreciated,
Richard.

PS. Could someone tell me when the new comp.sys.atari.programmer group is up and running please? (Unless ofcourse, the mediator posts something to that effect).

Hi I'm new to this group and to the Atari world. I have just bought a used atari with a broken mouse. I have heard that it is possible to connect the Microsoft Mouse to the Atari. Since I have an MS Mouse I'd like to find out if someone out there knows how to do this?

I have seen someone else asking the same question but no answer yet.

Thanx in advance for the help on this topic.

Thanks for the suggestion. It doesn't hang any more, but now when I try to
halt the system I get a fatal error for pid 0 - "kfree: memory not allocated
by kmalloc" or somesuch, and it forces me to reboot. That was with the
binary release of 1.12h2, but I even went as far as recompiling it myself
with exactly the same result.

Swap pins 2 and 3 on one end only.. and you have a null-modem cable.
Mine contains only three wires.. using pins 2, 3, & 7... works
great, and has done for ages. :-)

Source record: 28598

Sepulturiad Soldier <smiller@farad.elee.calpoly.edu> writes:

>Could someone direct me to a site where I can get instructions on how to
>setup the atari Linux (with the file list I need) or tell me what I need
>to do?

From the ftp site tsx-11.mit.edu in the directory "/pub/linux/680x0"
there is a set of directories:

bin
kernel
filesys
source

From the kernel directory get the files:

vmlinx09.pl4.gzip (or something to that effect)
ataboot04.gzip (or something to that effect)

Sorry I can't remember the real file names.

From the filesys directory get the most recent versions of:

rootfilesys.gz and
newfilesys.gz (again, something to that effect)

In the case of all of these files, unzip using gzip and/or
untar using gtar (gnu_zip and gnu_tar).

Once that has been done, place your Falcon/TT in ST high
compatibility mode. Then, create a ramdisk large enough
to hold the uncompressed newfilesys file. Next, copy
the newfilesys into the ramdisk. Finally, run the
ataboot4 program (.TTP) with the command line:

-d -k <kernel name> -r <newfilesys name>

The <kernel name> in this case is the uncompressed file
vmlinx09.pl4. Also bear in mind that the files designated
on this command line might require full path references
(i.e. m:\newfilesys.file)

With this done, you'll get a normal text screen telling you
the progress of the boot, and then linux will initialize
after you press <RET>. If all is well and good, you'll get
a normal UNIX-like command line prompt with a skeleton
filesystem (ramdisk) which will allow you to then mount a
TOS filesystem and copy over the 'root' filesystem. You will

have had to initialize a new filesystem on a HD using
mkfs.minix or mkfs.ext2fs first, however.

Unfortunately, I don't think the SCSI drivers for the Atari
are functioning correctly yet (at least not for me), so
all the work you will have done will be for naught, until
a new revision of the kernel with improved Atari drivers
comes along. A patch should probably be out shortly.

Sorry for the rapid-fire explanation, but if you want a more
detailed one please feel free to e-mail me, or if anyone's
interested we can continue the discussion here.

BTW, if anyone else knows the status of the Atari SCSI driver
for Linux 680x0 I'd love to know! It's really frustrating to
boot the kernel, and then not be able to do anything with it!!

Take care.

The screens are supposed to be on 256 byte boundaries - not 4 byte (otherwise
malloc would be fine as you said b4). Perhaps this changed in the STe???
But on my 1040STfm it would crap out (unless your malloc command is only using
memory that starts on a 256 byte boundary - would seem odd though).

Richard.

Mark, the medusa has been selling now for a few months in the U.S.A. and
in Germany (I believe it's also available in the U.K. now).

It is currently most definately the fastest atari around (and it has the
'060 prototype finished as well), however the price isn't cheap, it will
cost around 3,400 U$D for an 8Meg 450 HD Medusa System with tower, HDD and
all that sort of stuff.

Cheers

Yat @ Lexicor

Well let's give an answer then:
Yes it is possible to connect a serial mouse to your ST.
You will loss your only free serial port (if you have a 'just'
an ST) and you will need a special driver program:

I know currently of 2 such programs
-Wrapmouse (don't know if it is on any FTP site)
-MouseV21 (to be found on ftp.tu-clausthal.de), and other sites ??)

Hope this answers your question.

Regards
Rob

6621. MiNT Distribution Kit - Version 2.0

I have a TT with 4mB of st ram that I am trying to install MiNT onto and I am having problems...

I have two partitions, either of which I can use. One is ~50meg and the other is ~28meg. I set up the 'setup' program for the minix file system and for gem/mint and then goto install the minix partition and it just gives me two bombs. What is going on here?

The whole reason I am going tothe trouble of setting this up is that in the Linux68K docs it says that you need some of the gcc libs in order to set up properly. Is this true?

Auuughhh! I totally deleted 70 megs of junk on my HD to make the space for all of this and now it's not working... Can someone please help me? Thanks!

I should work on all TOS 1.x and 2.x versions. I'm not sure about 3.x and 4.x,
but I think it will work.

: The screens are supposed to be on 256 byte boundaries - not 4 byte (otherwise
: malloc would be fine as you said b4). Perhaps this changed in the STe???

The STe video shifter can handle all adresses, as long as they're even.

: But on my 1040STfm it would crap out (unless your malloc command is only using
: memory that starts on a 256 byte boundary - would seem odd though).

Just put something like

Real_screen = Screen_base && $ffffff00;

or so. Forgive me, it's a long time ago I programmed C.

You can't put in a 16Mhz 68000 without a special board. Someone reached
the speed of 10-12 Mhz on a standard ST board, but the rest of the hardware
wasn't to happy with that.
You can put in a 68010 as far as I know, but the TOS has to be modified
a bit. Or just use KAOS tos. The problem was on the booting process.
Don't know to much about it, though.

Use Diamong Edge to defragment you partition, and it fixes the illegal
files from the disk during the process. Or use Cleanup.prg which
comes with ICD pro utilities to clean the directories and FAT from
illegal stuff.

Use Gemini instead of Teradesk, as Teradesk is buggy.

6627. Atari Laser Printer Jams

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-08 12:29:32 UTC
From: ah931@cleveland.Freenet.Edu
Message-ID: <3c6u7c$423@usenet.INS.CWRU.Edu>
Source record: 28605

My Atari Laser Printer has starter to jam on an almost constant basis. I think that I have tried everything but to no avail. Does anyone have any suggestions, or has anyone encountered this problem.
Any help would be appreciated.

6628. DSP & Development Software

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-08 12:50:58 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3c6vfi$dud@dux.dundee.ac.uk>
Source record: 28606

Can anyone tell me what sort of applications might benefit from use of DSP, so far I have come across music & graphics, are there any other applications which it would be useful for?

Also what development tools would you reccomend?

Source record: 28607

Related topic here - has anyone else had a problem de-installing OMen?

When you install it, it creates some directories that you cann't delete...
..and they aren't set to read only, and their contents aren't set
to read only....yet you can only delete them from within OMen itself?

Craig.

6630. X11R5 - Keyboard problem.

If you're using ICDPRO, you should have a program called CLEANUP.PRG!!
Run this and select the partition holding the directory.
It will then search the fileinfo for illegal file- and dirnames, and prompt
you for a name change.

Stefan

6633. Re: Xbios Setscreen() details

Shawn Hargreaves (slh100@tower.york.ac.uk) wrote:
: I have a couple of questions about using the Xbios Setscreen() function
: to implement page flipping in an (ST low resolution) arcade game I am
: writing. I have been told that I should synchronize my code with the
: vertical blank before switching screens, but it seems to work without
: this. Do I need to call Vsync() before Setscreen(), or am I ok without?

When you make a Setscreen call, the Logbase is set immediately, while the
Physbase waits until the next vertical blank before it's set. This
doesn't pause your program like Vsync; the screen just doesn't get
switched until the next vblank.

: Also, I seem to rememver reading somewhere that Setscreen() can only
: display a block of memory whose address is a multiple of four. At the
: moment I am just using:

Actually, it's 256 byte boundaried on an ST and 2 byte boundaries on
STe and beyond.

: char *screen = malloc(32000);
: Setscreen(x,x,-1);

```
char *screen = malloc(32256), *screen2;
screen2 = screen + 256 - ((long)screen & 0xff);
Setscreen(screen2, screen2, -1);
```

This should do it. Later you should free(screen), not screen2.

: and it seems to work. If it is true that Setscreen() requires an address
: on a 4-byte boundary, malloc must just always be returning suitable
: values, but it doesn't seem like a good idea to rely on this. Does anyone
: have any experience of this?

: It is working on my 1040 STe without worrying about either of these
: issues, but I would like to know that I am not ignoring anything which
: may cause problems with other systems and TOS versions.

There's your answer right there. You're using an STe. If you want it to
work on an ST, use my code above. And if you make your pointer point to
words and not bytes, be certain to make the proper adjustment to the
value being added to the pointer.

6634. Re: DSP & Development Software

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-08 16:47:35 UTC
From: alenm@ifi.uio.no
Message-ID: <3c7db7$hqh@baugi.ifi.uio.no>
Source record: 28614

The DSP in the Falcon should be as far as I know, be able to
act as a modem. The US robotics modems have a DSP in it you know.
Why don't somebody make a softwaremodem for the Falcon? The DSP has
DA and AD converters and is connected to the DSP interface. All that
is needed (I think) is a program and a small converter to turn your
Falcon into a 28800 modem. The catch is it would not be approved by the
telephone companies and it would be illegal, but who gives a shit.
If anyone knows a lot about communications and has some spare time
PLEASE make them Falconowners happy and make a softwaremodem.

Long live the hacker-spirit.

6636. Two Parallel Printers On One Printer Port

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-08 19:32:41 UTC
From: de116@city.ac.uk
Message-ID: <1994Dec8.193241.15080@city.ac.uk>
Source record: 28617

I would like to connect two printers to my one parallel port on the falcon. Now before you suggest a printer switch, I want to ask if any one has bright ideas about how to make an intelligent switch that we then could software select, by accessory say, before print runs started. A small compact back of computer unit could then be built with the two sockets for each printer and this unit plugs into the ST.

My thoughts have evolved along the lines of somehow playing with the timing of the STROBE line. If its held low for, say, half a sec then the data that then presents itself on the data lines selects which port is used from then on. So, a normal STROBE signal would not affect this but a long one would.

Ideas anyone?

IN>machines somehow, so that 520ST would run like a terminal and Mega
IN>2 would do all the job for both. That connection would be only for
IN>experimenting, not for real work. I think Mega2 is too weak to be a
IN>workstation.
IN>
IN>1. Is it possible to do it under MiNT?
IN> If yes, how? RS232, MIDI, ...?

Yep, RS232 is the easies way, with a null-modem cable (NOT the cable
you use to connect with your modem!!!!)

IN>2. Can I run more GEM applications at once under MiNT? I have
IN>downloaded kernel
IN> and TOSwin and I can run only TOS programs.

Use MultiTOS, or another shell that can handle Multitasking

IN>3. If yes(2), can I run GEM application on "terminal" (=520ST), ie
IN>will I get the results on "terminal" screen?

Think so
```

IN>Any HW and SW tips would be appreciated.
IN>Thank you in advance

A Null-modem cable is an RS232-cable with the recieve and
transmit-pins swaped. Don't know wich pin that is, but there must be
someone here who does :-)
For software there are a lot possibilities; I'm now using STarCall and
I *really* like it. On Hensa you can find the German version; I'm
trying to get the engisch version there too, but haven't succeed yet
(some problems with my provider).

Thanks for the suggestion. It doesn't hang any more, but now when I try to
halt the system I get a fatal error for pid 0 - "kfree: memory not allocated
by kmalloc" or somesuch, and it forces me to reboot. That was with the
binary release of 1.12h2, but I even went as far as recompiling it myself
with exactly the same result.

Stephen

>Could someone direct me to a site where I can get instructions on how to
>setup the atari Linux (with the file list I need) or tell me what I need
>to do?

From the ftp site tsx-11.mit.edu in the directory "/pub/linux/680x0"
there is a set of directories:

bin
kernel
filesys
source

From the kernel directory get the files:

vmlinx09.pl4.gzip (or something to that effect)
ataboot04.gzip (or something to that effect)

Sorry I can't remember the real file names.

From the filesys directory get the most recent versions of:

rootfilesys.gz and
newfilesys.gz (again, something to that effect)

In the case of all of these files, unzip using gzip and/or
untar using gtar (gnu_zip and gnu_tar).

Once that has been done, place your Falcon/TT in ST high
compatibility mode. Then, create a ramdisk large enough
to hold the uncompressed newfilesys file. Next, copy
the newfilesys into the ramdisk. Finally, run the
ataboot4 program (.TTP) with the command line:

-d -k <kernel name> -r <newfilesys name>

The <kernel name> in this case is the uncompressed file
vmlinx09.pl4. Also bear in mind that the files designated
on this command line might require full path references
(i.e. m:\newfilesys.file)

With this done, you'll get a normal text screen telling you
the progress of the boot, and then linux will initialize
after you press <RET>. If all is well and good, you'll get
a normal UNIX-like command line prompt with a skeleton
filesystem (ramdisk) which will allow you to then mount a
TOS filesystem and copy over the 'root' filesystem. You will
have had to initialize a new filesystem on a HD using
~~~~~~

mkfs.minix or mkfs.ext2fs first, however.

Unfortunately, I don't think the SCSI drivers for the Atari
are functioning correctly yet (at least not for me), so
all the work you will have done will be for naught, until
a new revision of the kernel with improved Atari drivers
comes along. A patch should probably be out shortly.

Sorry for the rapid-fire explanation, but if you want a more
detailed one please feel free to e-mail me, or if anyone's
interested we can continue the discussion here.

BTW, if anyone else knows the status of the Atari SCSI driver
for Linux 680x0 I'd love to know! It's really frustrating to
boot the kernel, and then not be able to do anything with it!!

Take care.

Mark, the medusa has been selling now for a few months in the U.S.A. and
in Germany (I believe it's also available in the U.K. now).

It is currently most definately the fastest atari around (and it has the
'060 prototype finished as well), however the price isn't cheap, it will
cost around 3,400 U$D for an 8Meg 450 HD Medusa System with tower, HDD and
all that sort of stuff.

Cheers

The screens are supposed to be on 256 byte boundaries - not 4 byte (otherwise
malloc would be fine as you said b4). Perhaps this changed in the STe???
But on my 1040STfm it would crap out (unless your malloc command is only using
memory that starts on a 256 byte boundary - would seem odd though).

Richard.

Swap pins 2 and 3 on one end only.. and you have a null-modem cable.
Mine contains only three wires.. using pins 2, 3, & 7... works
great, and has done for ages. :-)

|>
|> I have seen someone else asking the same question but no answer yet.

Well let's give an answer then:
Yes it is possible to connect a serial mouse to your ST.
You will loss your only free serial port (if you have a 'just'
an ST) and you will need a special driver program:

I know currently of 2 such programs
-Wrapmouse (don't know if it is on any FTP site)
-MouseV21 (to be found on ftp.tu-clausthal.de), and other sites ??)

Hope this answers your question.

Message-ID: <1994Dec08.083111.188806@zeus.aix.calpoly.edu>
Date: Thu, 08 Dec 1994 08:31:11 GMT

I have a TT with 4mB of st ram that I am trying to install MiNT onto and
I am having problems...

I have two partitions, either of which I can use. One is ~50meg and the
other is ~28meg. I set up the 'setup' program for the minix file system
and for gem/mint and then goto install the minix partition and it just
gives me two bombs. What is going on here?

The whole reason I am going tothe trouble of setting this up is that in
the Linux68K docs it says that you need some of the gcc libs in order to

set up properly. Is this true?

Auuughhh! I totally deleted 70 megs of junk on my HD to make the space
for all of this and now it's not working... Can someone please help me?
Thanks!

I should work on all TOS 1.x and 2.x versions. I'm not sure about 3.x and 4.x,
but I think it will work.

: The screens are supposed to be on 256 byte boundaries - not 4 byte (otherwise
: malloc would be fine as you said b4). Perhaps this changed in the STe???

The STe video shifter can handle all adresses, as long as they're even.

: But on my 1040STfm it would crap out (unless your malloc command is only using
: memory that starts on a 256 byte boundary - would seem odd though).

Just put something like

Real_screen = Screen_base && $ffffff00;

or so. Forgive me, it's a long time ago I programmed C.

You can't put in a 16Mhz 68000 without a special board. Someone reached
the speed of 10-12 Mhz on a standard ST board, but the rest of the hardware
wasn't to happy with that.
You can put in a 68010 as far as I know, but the TOS has to be modified
a bit. Or just use KAOS tos. The problem was on the booting process.
Don't know to much about it, though.

>Any ideas ???

Use Diamong Edge to defragment you partition, and it fixes the illegal
files from the disk during the process. Or use Cleanup.prg which
comes with ICD pro utilities to clean the directories and FAT from
illegal stuff.

Use Gemini instead of Teradesk, as Teradesk is buggy.

Hey isnt this the ICD ADSCSI plus adapter your talking about ?

dma port in (from the ST) Dam out (through port) and a 50way connector because
that doesnt need another adapter you just connect the scsi devices
be they hard discs or tape streamers to the board and run up the
software.

Most scsi hard discs will work with this card and you can chain upto six
off the same icd adscsi card.

: about more than just left/right stereo? Maybe 4 or 8 or even 16 ins/outs
: (optional, perhaps?) for those with a musical interest?

: >1.44 internal drive, and HDD as standard (say 540M or so?)

: TWO internal 1.44 drives, PLEASE!

One as standard is enough IMHO.

: >A _separate_ keyboard - with keys that don't feel like a sponge (like my
: >1040STfm)

: And a REAL mouse, not this cheesy (pun intended) POS that Atari makes.

: Also, lets finally SEE (and not just hear about) a notebook version. ANd
: let's stop talking about products that won't be out for 18 months and then
: are discontinued along the way because they're old news when they're finally
: made available. In other words, the manufacturer should shit or get off
: the pot.

A minitower would be nice, as well as a lot of expansionslots. (Smart
design, please!) With the soundcard, SCSI-interface and Video as cards.
And a couple of independent DMA-channels. For convenient data-transfer.
With the right design, the expansion-cards would not need memory, it
would use ordinary memory, and use the DMAs to get the data.
Economical to upgrade, and easy to make compatible.

Harddisk as standard isn't one of my favourites, as well as a certain
amount of memory. Prefer to get it as bare as possible, to make it easy
to shop around, and use existing HW.

Regards, Tommy

6646. GOOD ATARI WORDPROCESSERS...!!!

All these ravings about good Atari Word Processers or
Document Processers...

One Big problem with German ones is the lack of good spelling/Thesaurus
support...

The other problem is these later version need a high res monitor and
4 megs of Ram and a hard disk....

How about a good FAQ on Word Processers/Document Processers and lets
distinquish the differences here...

Please don't list German ones like Script 3.5, that are only German,
the German only ones can be in their own section...

Also list old versions, ones that do need hard drive support ones that need a
high res monitor, ones with scalable fonts, how much ram is needed for
graphics and number of pages, bugs and machine type, etc....

Any takers on this...??

: xx49-6131-475762

: PAMs NET works with Ethernet and is able to do TCP/IP
: (which is included, I think)

One of the more interesting network solutions they have is the Flex-Link.
It is an adaptor that you connects to the SCSI-port and gives you the
possibility to also use it with Macs, PCs and notebooks (parallell-port).
It has the following specs:

* Works with Apple MacIntosh/Powerbook, Atari Falcon/TT, PC & Notebook.
* SCSI- and parallel-connectors
* 2-in-1 technology (BNC and Twisted Pair)
* Ethernet 10 Mbit/s
* IEEE 802.3 Standard
* Pocket design
* Fast
* 32 KByte RAM
* Software included
* Add-on for Novell Netware
* IPX-protocol

And some other stuff I don't understand. (Got a German spec-paper here,
and German isn't one of my virtues...)

The only thing that made me think before deciding to buy one, is the
price, which is some 990 DM (5000 SEK or 600 USD).
Quite expensive, but how fun would it not be to have one and have a
really fast network with your PC!

: > Usually (An) and (An)+ uses the same amount of CPU-cycles!!

: seems true...

Calculating clockcycles needed for certain instructions is a whole science, since the design of the ST makes the benchmarks presented by Motorola for the 68000 not correct.

First of all, The MMU in the ST "evens" out all instructions clock-cycles to an multiple of 4, thus an instruction always takes 4, 8, 12, 16, 20 etc clockcycles to perform. (a 14 cc instruction grabs 16 cc's)
But that's not entirely true, in some cases 2 following instructions that needs a non multiple of 4 clockcycles to perform, "melts" together, and uses the number of clockcycles stated in Motorolas Benchmark.

This a very annoying fact when writing overscan-software for the ST, if you don't have adequate tools.

I've seen several sources that will measure the amount of clockcycles an instruction or routine needs. If there is an interest I could mail it here, it isn't very long, approx 3 kb ascii.

It was a long time since I played around with this, so there might be an error or two.

Regards, Tommy

I cannot run Papyrus (3.51) on my "home" TT, in any colour mode -
the program runs, but the characters misbehave impressively -
sometimes (rarely) OK, generally _very_ blocky, illegible, etc.
I have a Crazy Dots card, NVDI 2.5 (ET4000), and SpeedoGDOS 5
installed.
Does anybody know which is causing the problem (it's not NVDI)?
And, more importantly, if/how I can fix it?
thanks in advance, Mike

Should be able to. I connected a PC 1.44Mb to my ST when my floppy drive
went dead, but it's 720K still. I heard that TT have a builtin Ajax chip that
allows high density drive access. This means you can use 1.44Mb diskettes.
You need to set a jumper for that to happen, which since I do not own an TT,
cannot tell you which to set.

>

With most languages, such as C wtc, you use fsel_exinput, but this only works
for TOS versions >1.4. Most programs get round this by putting a box with
text in it on the screen under the fileselector, but this causes problems
with oddly sized selectors such as UIS, in that you can't actually see the
text.

I don't think there's a way to put text in the fileselector in TOS 1.02, but
I may be wrong with regards to UIS...

Sometimes I had the problem (with SpeedoGDOS 4.2 not 5.0 but maybe...)
that SpeedoGDOS _wrote_ into the .SPD files.

Try to copy the .SPD files from your original SpeedoGDOS disks in your
GEMSYS folder and try again.

>instructions with the STOSFX27.

As I understand it your patch only fixes STOS for your own current TOS.
Any chance of a version of your patch which will install all the later
versions of TOS into the table in one go? That way ST/STE owners could
write programs which worked on the Falcon straight away.

Please , Please , Please.

> That keyboard problem does not happen with this fix. The fix that

Try stripping the debug info out, then. A large part of that 300K is
debug symbols. I believe that these are not loaded anywhere when the
executable is run anyway, so they just take some disk space.

From: npetrlik@public.srce.hr
Message-ID: <3c9ufa$atd@nippur.irb.hr>
Source record: 28639

Hi to all !

I have 1040STFM, HD 60, and a DD disk drive.
Recently, I bought 100 HD noname
disks already formatted to 1.44MB and tested.
I format them with Fastcopy Pro to 11 sectors,
82 tracks with verify on. (No errors occured while
formatting). But, when I try to copy some files
on that disk (with Kobold2) then ... errors got
appeared ...
I've tried to change the interleave and skew factor,
but without any major improvements ...
Maybe I must change some other factors, or I must
format the disks several times?
Does anyone had the same problem?

Please, help!

The better way is to use the version of mkfs included in the
root.tar. Extract it to your harddisk befor booting linux.
After the first boot from your ramdisk mount the partition with
the linux executables with
mount -t msdos /dev/sda1 /mnt
for example. /dev/sda1 is the first partition on the first scsi-hd.
Then use your executables from root.tar.gz to create a minix
or ext2 filesystem.

>Unfortunately, I don't think the SCSI drivers for the Atari
>are functioning correctly yet (at least not for me), so
>all the work you will have done will be for naught, until
>a new revision of the kernel with improved Atari drivers
>comes along. A patch should probably be out shortly.

On a TT it works. vmlinux-0.9pl4.gz was the first generic
kernel from tsx-11 who works for me.
I don't try it out, but with a patched vmlinux-0.9pl3 kernel
and bootstrap0.3 I can't boot the ramdisk. I hope it
works with bootstrap-0.4. My file-system is up und running,
so I could boot from it without ramdisk.
(bootstra root=/dev/sda7 for example)

>BTW, if anyone else knows the status of the Atari SCSI driver
>for Linux 680x0 I'd love to know! It's really frustrating to
>boot the kernel, and then not be able to do anything with it!!

My former problems with the Atari SCSI driver are gone with
a lot of patches to vmlinux-0.9pl3 which are included in
vmlinux-0.9pl4. But I can only speek for my TT.

High res monitor is the minimum requirement for any word processing
anyway (you cannot distinguish the letters if you use 80 columns or
more in ST-Med or ST-low). Also the SM 124 & 144) have 70Hz rate, which
is good for your eyes.

Better still, get SM 194 (I had it for 3 years, it was wonderful) or
Falcon with 17" :-)

>How about a good FAQ on Word Processers/Document Processers and lets
>distinquish the differences here...

Yes, it would be great.

6664. Need help with ST drives

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-09 20:40:42 UTC
From: martinm@sps1.phys.vt.edu
Message-ID: <3cafca$m8d@solaris.cc.vt.edu>
Source record: 28542

Quite a few years ago I got a 6520STfm, and it was nice. However, it came with a junky SSDD Chinon floppy drive. At the time it would have cost $200 to have a better DSDD drive put in, which I couldn't afford. However, these days, I can get a 1.44MB drive quite cheaply, so I was wondering if I could put one of these in. I saw a post on this group in the past few weeks by someone who said he found a document about this on an ftp site (which one? I've seen nothing about this at umich), so I think it should be possible. The one problem is this: the Tramiels, in their infinite wisdom, chose to use a non-standard (well, ok, this might be PC-biased) floppy interface on the motherboard. Thus when I open my ST up I find that there is a funky adapter cable with special circuitry on it to connect the drive to the motherboard. The real problem is that the old SS drive has the pins protruding out from the back of the drive case, and the cable connector attaches to this. However, the PC floppy drives have the pins recessed into the back of the drive, so the connector can't reach them. So I guess I have two options:

1) Find someone with an extra DSDD floppy drive. I e-mailed one person selling off 1040STe parts for scrap, but he said his drive has the recessed pins just like the PC drives.

2) Find or make some type of special adapter to allow me to connect a PC drive.

So, does anyone have a DSDD drive, presumably from an old STfm, they'd be willing to part with (for a reasonable price)?
Or, can anyone give me advice on how I could find or make a floppy cable extender? I haven't seen this sort of thing at Radio Shack.
I should probably note that I am not really that desperate to fix this. I just thought that I might get a little more use of the old ST (I can set it up at home and play with it between semesters at school).

While I'm on a related topic, I was also wondering about the possibility of getting a small hard drive for it. I remember that E. A. Brown had a HD adapter in their catalog that would let you connect a standard HD (MFM?) to the ST, but they wanted around $120 or so for it (and the drive itself back then was several hundred dollars). I have seen people selling old small MFM drives (like 40 or 80 MB) for somewhere around $50 (or less), so it almost within my "optional items" budget. But I would still need an Atari-to-MFM adapter (with cables). Does anyone know where I could get one cheaply? $120 is completely out of the question. Or does anyone have a complete external HD setup they'd like to get rid of? (Has to be less than $100, though.)

Hmm, ok, just one last question: I have recently tried the Xformer 8-bit emulator for PC's (running on my '486), and I am impressed at how well it

seems to work. I understand that the same guy has an ST emulator (called "gemulator" I believe). Can anyone tell me how well it works? Can it run stuff like Dungeon Master (with sound on a PC sound card)?

Well, thanks in advance for any help you can offer me!

-Michael

6665. '040 board??? Why not '060 board instead?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-09 21:33:30 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELKKAFUSUp@stingray.manawatu.gen.nz>
Source record: 28543
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I was just wondering after seeing all the posts about 040 boards for the Falcon...

Why aren't they making an '060 board for the Falcon instead??? I don't know the specs of the '060, but if it's out - why don't companies drop any '040 board and work on an '060 board?

I guess that the data lines will probably be 64 bit instead of 32? (This is just a presumption). Would that create problems with current Falcons?

Or is it that the '060 chip is more expensive than an '040? I don't think this would matter as if you are going to buy an accelerator board, surely most would go for an '060 as it is bound to be faster than any '040 (unless someone made a _serious_ mistake).

Do you all agree/disagree?

System Solutions +44 (0)1753 832212 will go a bit better and do a T28 or even a T36 acclerator for the ST. The T28 I have here for over a year now has been rock solid and cost just under 200 quid. Get NVDI or Warp ontop of that and the whole thing really flies :-)

Compatability , well some games don't like it but it can be switched off.

Powerdos/datnet cartridge networking solution doesn't like it unless I switch the cpu cache off, it does not bomb just does not see the other machines on the network, The cache can be turned on/off on the fly so its no big hassle.

I know that NVDI sometimes makes the letters smaller and most programs
can't handle that. Don't know how to change that tough...

6668. hard drives and the Link II

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-10 02:30:18 UTC
From: michael@tapestry.cs.umass.edu
Message-ID: <3cb3rq$nmq@kernighan.cs.umass.edu>
Source record: 28546

[Article crossposted from comp.sys.atari.st,comp.ys.atari.st.tech]
[Author was Michael Kieras]
[Posted on 9 Dec 1994 22:24:35 GMT]

I recently bought a Link II to replace my old ICD host adaptor, and I wanted to have a chain of SCSI devices instead of just my old 85 meg drive. I bought the Link II so I wouldn't be locked into using the 85 meg with the Atari. Well, since it already had it's resistor packs for termination, I figured I would make that the end of the chain and connect the other drive in from of it (a SyQuest). The SyQuest was SCSI id 4 and the 85 meg was SCSI id 0.

When I hooked the Link II directly to the 85 meg and had no other drives connected, it worked fine. When I put the SyQuest into the chain, I couldn't reliably access the 85 meg; it wouldn't make it through a boot. The light on the interface was on, so it was getting *some* termination power at least, but I trashed my C partition real good trying to access it.

Since then, I've gone back to my old host adaptor, and used the new ribbon cable to make the 85 meg the first on the chain. I've also taken the resistor packs off of it and slap a terminator onto the external connector if it's going to be the only drive, and it works fine with the chain or not.

My question is, what sort of requirements and restrictions are there when using the Link II? I don't remember seeing anything that would apply to my situation in the docs, but I'll look again. Anyone else have similar problems?

: know the specs of the '060, but if it's out - why don't companies drop
: any '040 board and work on an '060 board?

I have heard that the 060 is MOSTLY compatible with the 040 but it is not
DIRECTLY pin compatible. There may be an upgrade board that will allow
an 060 too be used in a 040 slot on any platform.

I was wondering the same thing... The only way I'll get an 040 accelerator
for my Falcon is if there is a upgrade path to the 060.

Please correct my info if it's inaccurate.

Greetings,

Can anyone help with info on hacking a blitter into a 520ST?

I have the 1985 motherboard w/4 meg, Overscan, AdSpeed, ATKey, etc, but
I haven't been able to collect enough information for this Blitter
upgrade.

I heard that there might be documentation on an FTP site somewhere also.

Take care,

Jeff

Sorry to change topic so dramatically, but what the heck is the deal
with SCSI drivers for Linux/68k for the Atari? I can't get the
latest kernel binary (.9pl4) to communicate with my drives......

Has anyone done this sucessfully using an external SCSI drive on
a Falcon?

You need the mintlib to compile the m68k-linux bootstrap (currently there
is no bootloader). If I were you I wouldn't bother to install MiNT only to
compile that bootstrap. Just get a binary, and once you installed linux
you can cross-compile the mintlib and bootstrap under linux (you won't
need a cross-gcc/gas, just a cross-ld is sufficient).

From my trusty "Concise Atari ST 68000 Programmer's Reference Guide",
the Vsync() call waits for the next vertical blank, then returns, and
Setscreen() sets the logical screen location (where drawing will be
done) NOW and sets the physical screen location (what's displayed) at
the NEXT VBLANK.

If you do not use a call to Vsync() it is possible that you could
switch frames, then start updating the logical screen while it's still
being displayed. I don't know whether it's better to call Vsync()
before Setscreen() or after, though.

malloc() always (AFAIK) returns a block of memory with the processor's
strictest alignment requirements fulfilled; on the ST, this means that
it's certain to give an even address. (Your malloc() may give stricter
alignments than this, though.)

On an STe the screen memory must be aligned on any word boundary (or
possibly only longword? I'm not sure about this), so your code works
okay on your STe. However, on a normal (old) ST (not e) the screen
memory must be aligned on a page boundary: it must be divisible by
256. This is because the ST's shifter only has two one-byte registers

to hold the screen base address, whereas the STe's shifter has three
one-byte registers, and can cope with an extra 8 bits of resolution in
the base address.

I had some code to set up a screen which is below (edited down somewhat
from the original). The program this came from works fine on my 4Mb
520STe and 1/2Mb 520STfm, and compiles with MiNTlibs under gcc 2.5.8.

```
---------------------------------------
#include <stdlib.h> /* for malloc()/free() */
#include <osbind.h>

typedef unsigned char byte;
typedef unsigned short word;
typedef unsigned long longword;

static word *screenmem=0;
word *screen=0;

static word *oldphys, *oldlog;
static word oldres;

const int SCREEN_SIZE=32000;

int
open_graphics(void)
{
screenmem=malloc(SCREEN_SIZE+256);
screen=((word *) ((((longword) screenmem) + 255) & 0xffffff00));

oldphys=Physbase();
oldlog=Logbase();
oldres=Getrez();

Setscreen((longword) -1, (longword) screen, (word) 0);
}
---------------------------------------
```

Hope this helps.

6679. STBook Notebook Portable ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-10 22:09:31 UTC
From: trev@perth.DIALix.oz.au
Message-ID: <3cd8ur$h89$1@perth.DIALix.oz.au>
Source record: 28560

I have a couple of Atari STBook notebook computers with 40Meg Hard drive and 1 meg ram. There are a few things that you may be able to help with information.

1. The STBook comes with ST TRANS program to transfer files between STs and this software has menu options for both serial and parallel connections. I have the serial system working well but have not been able to get the parallel side working where no doubt a special cable is needed. Does anyone have the PINOUTS & CONNECTION diagram for this cable?

2. The 1Meg ram is made from Toshiba TC518128AFL-10LV chips (8 of them). What chips are needed to take the STBook to 2 or 4 Meg and what other hardware modifications are needed? Are the bigger ram chips pin compatible with the ones already installed?

3. With the current setup the STBook bombs before getting to the desktop (and in fact is not able to display the desktop) unless it finds the internal IDE Hard Drive. This may be because of the TOS setup or it may be because of the software on the "P" drive, which is ANOTHER rom chip. There is a bank of eight DIP switches just a little to the left of the middle of the circuit board. Does one of these tell the STBook to boot without hard drive? Is there any other way to tell it to boot successfully without hard drive?

4. Does anyone have circuit diagrams for the STBook? Were they actually officially released in your part of the world? They were not released here in Australia, I got mine at the fire sale when Atari closed their office in Sydney, Australia.

Thanks for any info.

Trev Holland. {trev@perth.DIALix.oz.au}

>print runs started. A small compact back of computer unit could then be built with
>the two sockets for each printer and this unit plugs into the ST.

I am in the process of designing such a unit at present. It will use the
standard escape-code method, where for example you will send:

ESC,L,n

where n is a number from 0 to 15 to select the port required. (Of course
I won't actually build a 16 way switch unless I suddenly have a need for
it, but the provision is there).
This can be sent either from a little desk accessory, or from within
your program, so for example you could change your WP settings so anything
to be printed in BOLD would print to printer #2 and anything in italics
to printer #3, if you really wanted to.

The 'L' won't actually be 'L' as this is probably used by many printers
for font settings etc, but I will have to do some research to find some (1)
'free' codes.

Don't hold your breath though, I usually design my projects at a /very/
leasurely pace! :-)

I'm pretty sure it's impossible to emulate a 68030 with a 68000,
especially the MMU stuff (i.e. the stuff that allows virtual memory).
You cannot restart a 68000 in the middle of an instruction, unlike the
68030.

From: q_bert@delphi.com
Message-ID: <BS8U2jf.q_bert@delphi.com>
Source record: 28563

If you follow the instructions given in the program, the bar and box commands will work properly. As for the multiple TOS versions, someone else suggested that to me a little while back and I did have a working version of it ready to distribute, but I had a problem with a FAT cache on my hard drive and I ended up losing the whole program. Luckily, I had a copy of STOS Fix 3.0, but not with the support for multiple TOS versions.

I've been working on getting back to where I was, but with work and school, it's taking a little longer than I expected.

Actually, what you could do (and no-one has yet) is write a version of
the AES/VDI libraries which droped message into pipes & write sort
of GUI server application which provided windowing & GUI support to all
other apps in the system. You would need to re-compile GEM apps to run
on it though. Perhaps writing a library on top of X Windows would be a good
alternative 'coz then you get to use your apps on big workstations as well
as the atari (X runs on the atari as well). Open the door to distributed
GEM apps? Dreams.......perhaps, but it could be done.

>How long are you willing to wait? Maybe you should look at MagiC 3 instead.

Ofir is right on this one, atari will never release an update of multiTOS
"the parrot is dead, deceased, an ex-parrot".

Worth noting that X on the atari on top of MiNT is actually faster and more
stable than multiTOS anyway but uses 4 times as much memory :(
We really need virtual memory in the MiNT kernal - cann't they poach the
Linux VM code or something (but don't use the FPU code)?

Craig.

>
>Don't know how to find out which accs are loaded, but
>calling them is easy - use appl_write() to send an AC_OPEN
>message to the accessory.

If you know the name of another running application (be it an ACC under normal TOS or a ACC or application under MultiTOS), you can find it's application ID via:

```
int id = appl_find( "NAME\0\0\0\0" );
```

Note how the application name is padded out to 8 characters with NULLs.

If you're using Warwick's fine GEM++ C++ class library, you'd use:

```
GEMapplication other_app( "NAME" );
```

There doesn't appear to be any way of finding out what applications are actually running though. Very bozotic. If MultiTOS is running, you could find the process ID of the AES, and then find it's children...

i'm runnung ghostlink on a tt at modem2 with 38400. i also have hsmodem04
installed. i think it is important you have selected 'no handshake' at your
modem cpx.

6688. Re: Xbios Setscreen() details

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-11 19:28:00 UTC
From: jaszcz@louie.EEAP.CWRU.Edu
Message-ID: <3cfjs0$a7k@usenet.INS.CWRU.Edu>
Source record: 28569

Shawn Hargreaves (slh100@tower.york.ac.uk) wrote:
: I have a couple of questions about using the Xbios Setscreen() function
: to implement page flipping in an (ST low resolution) arcade game I am
: writing. I have been told that I should synchronize my code with the
: vertical blank before switching screens, but it seems to work without
: this. Do I need to call Vsync() before Setscreen(), or am I ok without?

You're ok without. Setscreen doesn't change anything until it is synced
with the display.

: Also, I seem to rememver reading somewhere that Setscreen() can only
: display a block of memory whose address is a multiple of four. At the
: moment I am just using:

```
: char *screen = malloc(32000);
: Setscreen(x,x,-1);
```

In the older ST's, it was a multiple of 256, or a "page boundery" . I do
it like this:

```
long page_to_free,new_page;

new_page = get_page(&page_to_free);

long get_page(page_free)
long *page_free;
{
*page_free = Malloc(32256L);
return (*page_free + 256 - (*page_free % 256)) ;

}
```

.... this returns the correctly positioned page, and also expects a
long value pointer for the initially returned value from malloc (so you can
free it later) .

: and it seems to work. If it is true that Setscreen() requires an address
: on a 4-byte boundary, malloc must just always be returning suitable
: values, but it doesn't seem like a good idea to rely on this. Does anyone
: have any experience of this?

it's strange. try loading some accessories, and running the program.
you may be getting the same area in memory every time, if you run exactly
the same setup.

I need a reliable way to detect what hardware setup my program is running on (in particular the processor type and whether it is an ST, STE, TT or Falcon). I presume there must be a pretty easy way of doing this: anyone know how?
Thanks,

Shawn Hargreaves "God is real, unless declared as integer."

6692. Falcon Spec Sheet

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-12 10:18:59 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3ch82j$hlt@dux.dundee.ac.uk>
Source record: 28574
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Okay, here it comes...again!!!

Atari Falcon 030 Specifications

CPU: Motorola 68030 32-bit microprocessor @ 16MHz w/ 32-bit bus
FPU: Motorola 68881/68882 @ 16MHz (optional)
DSP: Motorola 56001 Digital Signal Processor running in parallel @ 32MHz
w/ 32kWords (24-bit) of local zero wait state static RAM
ROM: 512kB
RAM: 1, 4 or 16MB(14MB usable) on daughterboard (RAM is 32-bit wide)

Expansion bus: Internal 'Processor-Direct' slot for 386SX emulation
(third party 386SX emulator nearly completed) or other
co-processors/etc.

Video: (See below for specific video modes/resolutions.)
16-bit BLiTTER @ 16MHz (also handles hard drive access)
Accepts external video sync to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan support
Hardware-assisted horizontal fine scrolling
VIDEL (video controller) sits on 32-bit bus

Audio: Stereo 16-bit Analog-to-Digital DMA input
Stereo 16-bit Digital-to-Analog DMA output
Eight 16-bit audio DMA record/playback channels
SDMA sound/DMA co-processor

Ports: 128kB cartridge port
2 9-pin mouse/joystick ports
2 15-pin STe enhanced analog/digital controller ports (Atari also
has new analog controllers w/ a joystick, 3 fire buttons, and a
12-key keypad)
MIDI IN, OUT/THRU
Bi-directional parallel port
RS232C serial port
SCSI II w/ DMA
Analog RGB/VGA/composite video connector
Stereo headphone out (1/8" mini-jack)
Stereo microphone in (1/8" mini-jack)
DSP port (up to 1MHz data transfer rate)
RF modulator for TV hookup
Localtalk compatible LAN (up to 250kbaud transfer rate)

Misc: Internal 1.44MB 3.5" HD floppy
Internal IDE 2.5" hard drive (optional)
Pre-emptive mulitasking OS (MultiTOS) w/ adaptive prioritization
and inter-process communication (also 68040 compatible)
Realtime clock and battery backed up RAM
1040ST-style case w/ internal fan
North American availability in mid-October

Price: 1MB/no HD - $799 list
4MB/65MB - $1399 list

Resolutions available on the Atari Falcon030 (c) 1992 Atari Corp.
Written by John Townsend
==========
This document may be re-printed again and again as long as the Atari
copyright remains intact.
==========

A couple of notes: Unlike previous machines, there are just too many
resolutions to give each resolution a name. Therefore, I will do my best
to describe what the resolution is and which monitor it is on.

- NOTE: TV and a Color Monitor are the same.. by Color Monitor, I am
talking about the standard SC1224. By VGA, I mean a standard VGA
Monitor.

40 column modes ("column" means the number of x pixels divided by 8)
---
4 color, normal, TV: 320x200, 4 colors, 2 planes
16 color, normal, TV: 320x200, 16 colors, 4 planes
256 color, normal, TV: 320x200, 256 colors, 8 planes
True color, normal, TV: 320x200, true color

4 color, interlace, TV: 320x400, 4 colors, 2 planes
16 color, interlace, TV: 320x400, 16 colors, 4 planes
256 color, interlace, TV: 320x400, 256 colors, 8 planes
True color, interlace, TV: 320x400, true color

4 color, normal, VGA: 320x480, 4 colors, 2 planes
16 color, normal, VGA: 320x480, 16 colors, 4 planes
256 color, normal, VGA: 320x480, 256 colors, 8 planes
True color, normal, VGA: 320x480, true color

4 color, line-doubling, VGA: 320x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 320x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 320x240, 256 colors, 8 planes
True color, line-doubling, VGA: 320x240, true color

80 column modes
---
2 color, normal, TV: 640x200, 2 colors, 1 plane
4 color, normal, TV: 640x200, 4 colors, 2 planes
16 color, normal, TV: 640x200, 16 colors, 4 planes
256 color, normal, TV: 640x200, 256 colors, 8 planes

True color, normal, TV: 640x200, true color

4 color, interlace, TV: 640x400, 4 colors, 2 planes
16 color, interlace, TV: 640x400, 16 colors, 4 planes
256 color, interlace, TV: 640x400, 256 colors, 8 planes
True color, interlace, TV: 640x400, true color

2 color, normal, VGA: 640x480, 2 colors, 1 plane
4 color, normal, VGA: 640x480, 4 colors, 2 planes
16 color, normal, VGA: 640x480, 16 colors, 4 planes
256 color, normal, VGA: 640x480, 256 colors, 8 planes

4 color, line-doubling, VGA: 640x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 640x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 640x240, 256 colors, 8 planes

and lastly.. there are compability modes for ST Low, ST Medium, and ST High on both VGA monitors and SC1224 monitors. (On a color monitor, ST High is achieved by using the interlace mode).

Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as well. However, it only supports one resolution: ST High Resolution.

All modes on a TV can be overscanned. This means multiplying the X and Y resolution by 1.2. For example, modes with 320 pixels of horizontal resolution (X res) will become 384 pixels across, and modes with 640 pixels will become 768 across. Overscanning is done in the X and Y resolution. You can't do them independently. Special Note: On a VGA monitor, overscan is "faked".. since the video hardware doesn't have the capability to do overscan on a VGA monitor, we made it so that if a overscan mode is set on a VGA monitor, you still see the normal size screen, but the screen is a window onto the bigger overscanned image. Make sense? We did this for compatibility. This way if a game that has an overscanned starup picture can use the same pic on both the VGA monitor and the TV monitor. Pretty cool, eh? <grin>

BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will work just fine with it, but because you can't see the parts of the screen, we thought that that option shouldn't be available from the desktop. We don't want to confuse people. However, Overscan can be set using a new XBIOS call (Vsetmode()).. so it is still available.

I hope I haven't made any mistakes. I triple-checked this document in search of errors and I couldn't find any. If you do find some, send me Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.

-- John Townsend, Atari Corp.

P.S. Anyone who would like to reprint this message, please do so! The smaller the number of times I have to type that message, the more my fingers with thank you! ;-)

After looking at this one more time.. one point to clear up: By saying SC1224 Color Monitor, I mean any Color Monitor that Atari

have manufactured for the ST/Mega/STE/MegaSTE computers. Clear
as mud? ;-)

Reply-To: piet@cs.ruu.nl (Piet van Oostrum)
Organization: Dept of Computer Science, Utrecht University, The Netherlands
Lines: 470
In-Reply-To: kjohnson@castor.cs.uga.edu (Kristopher Johnson)

I found this file on the local ATARI Company's BBS : (original in Dutch)

This article is written by Wilfred Kilwinger (Support Manager) for
Atari Briefing, the newsletter by Atari (Benelux) B.V. for the Atari
user groups. It was specifically stated that it could be reproduced. I have
translated it in English with the assumption that an English translation
would be considered the same as the original.

The original also contained a description of all the features of the Falcon
which have been reproduced here a zillion of times so I did not include
these.

Atari custom chips

VIDEL

The VIDEL takes care of the video functions of the system including
overscan, overlay mode and true color graphics

COMBEL

The COMBEL is the system manager of the Atari Falcon030. This chip controls
all system functions. Also the BLITTER is built in in this chip.

SDMA

The SDMA is the Sound DMA and controls the sound part. We have built in a
unique matrix switch function in this chip (more details in the second part)

KEYBOARD PROCESSOR

The keyboard processor has been improved and is now also suitable for high
resolution mice.

Besides the above custom chips the Atari Falcon030 has a number of standard chips like the Motorola 68030 and 56001 DSP. Another important chip is the CODEC in which the 16 bit AD and DA converters are located.

Video modi

As you can see in the survey of Operating System calls
the video hardware is complete sotware controllable. The following
combinations can a.o. be chosen:

Mode Resolution Bit planes Colors Palette

ST LOW 320x200 4 16 4096
ST MED 640x200 2 4 4096
ST HIGH 640x400 1 2 4096

True Color 640x480 8 256 262144
320x200 15bpp 32768 N/A

The last mode asks for some explanation. Here there is no color palette but
15 bits per pixel to describe the pixel itself. The format is
RRRRRGGGGGXBBBBB. VDI supports this mode thus programs that have not been
written for this mode specifically can use it nevertheless.
X is the overlay bit and can be used for video titling and special effects.

320x200 16bpp 65 N/A

This mode is called the slideshow mode, is not supported by the VDI, you
are on you own. X is an extra green bit.

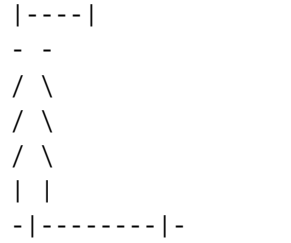
True Color in 640x480 is not possible because of the bandwidth of VGA monitors.

Mode Resolution Bit planes Colors Palette

VGA 320 of 640 1,4,8 2,16,256 262144 (Overscan
Video 200 of 400

With Video we mean the Atari SC-monitors, the TV modulator and/or the
composite video output.

All modes can be gegenlocked. With adaptors we convert
the 15-pole video bus to thee standard Atari or VGA connections.



Matrix coupling

To make the system performance in the audio part as good as possible Atari
designed a miniature 'telephone exchange' that can easily connect the
source devices to the receiving devices. Also it is possible to make more

than one connection at a time.

De volledige beschrijving van bovenstaande functie's staat in de Falcon030 Developers Documentation.

VIDEO SETMODE

```
int setmode( int modecode );
```

The setmode(int modecode) call is used to place the Falcon/030 SHIFTER into a specific mode. A bit-encoded value (called a "modecode") is passed to setmode() to set the mode. setmode() returns the previous mode that was set.

To help make the building of modecode values easier, here is a table of defines:

```
#define VERTFLAG 0x100
#define STMODES 0x80
#define OVERSCAN 0x40
#define PAL 0x20
#define VGA 0x10
#define TV 0x0

#define COL80 0x08
#define COL40 0x0
#define NUMCOLS 7

#define BPS16 4
#define BPS8 3
#define BPS4 2
#define BPS2 1
#define BPS1 0
```

Using these defines, you can build a modecode for any possible mode. For example:

For True Color Overscan:
modecode = OVERSCAN|COL40|BPS16;

For ST Medium Compatibility mode on a Color Monitor/TV:
modecode = STMODES|COL80|BPS2;

For ST Low Compatibility mode in PAL on a Color Monitor/TV:
modecode = STMODES|PAL|COL80|BPS2;

For 256 color, 80 column mode on a VGA monitor:
modecode = VGA|COL80|BPS8;

If you have a modecode and wish to know how many bits per pixel it
has, use the following:

```
if( modecode & NUMCOLS ) == BPS16 )
do_something_cool(); /* You have true color mode */
```

The setmode() call will return the previous modecode set. You must use
this value to get back to whatever mode you were in before you made your
setmode call.

```
int mon_type(void)
```

The mon_type() function will return the kind of monitor that is currently
in use. Here are the possible return values:

0 = ST monochrome monitor
1 = ST color monitor
2 = VGA monitor
3 = Television.

```
void ext_sync( int flag )
```

This function sets or clears external sync. If flag is set, external
sync is enabled. If flag is clear, then internal sync is used.

SOUND-calls

```
locksnd();
```
Used as a semiphore to lock the sound system. From other applications.

```
unlocksnd();
```
Used to release the sound system for other applications to use.

```
soundcmd(mode,data);
```
This command is used to get or set the following sound parameters.
If a negative number is used as the input then the current setting us
returned.

MODE OPERATION MEANING

0 LTATTEN Sets the current left channel output

1 RTATTEN Sets the current right channel output

2 LTGAIN Sets the current left channel input gain.

3 RTGAIN Sets the current right channel input gain.

4 ADDERIN Set the output of the 16 bit signed adder to
receive it's input from the ADC, Matrix or
both.

5 ADCINPUT Set the input the the ADC. The input can either
be the left and right channel of the PSG or the
left and right channel of the microphone.

6 SETPRESCALE Used for compatability. This prescale value
is used when the DEVCONNECT() internal
prescale value is set to zero.

setbuffer(reg,begaddr,endaddr);
This function is used to set the play or record buffers. REG selects
playback or record, while begaddr and endaddr are the buffers beginning
and ending locations.

(int) reg - (0) Sets playback registers.
- (1) Sets record registers.
(long) begaddr - Sets the beginning address of the buffer.
(long) endaddr - Sets the ending address of the buffer.

setmode(mode);
This function is used to set record or playback mode. The modes are as
follows:

MODE OPERATION
(int) 0 8 Bit Stereo
(int) 1 16 Bit Stereo
(int) 2 8 Bit Mono

settracks(playtracks,rectracks);
This function is used to sets the number of record or playback tracks.

setmontracks(montrack);
This function is used to set the output of the internal speaker to one of
the four tracks currently playing. The internal speaker is only capable of
outputing ONE track at a time.

setinterrupt(src_inter,cause);
This function is used to set which interrupt that will occur at the end of a
frame. If the frame repeat bit is on, this interrupt is used to allow for
double buffering the playing or recording of sound. Interrupts can come from
TimerA or the MFP i7.

buffoper(mode);
This function is used to control the operation of the play or record buffers
in the sound system. The input to this function is a bitmap. If mode is set
t0 -1 then the current status of the buffer operation bits is returned.

NOTE: The sound system contains a 32 byte FIFO. When transferring data to
the record buffer, software MUST check to see if the record enable (RE) bit
was cleared by the hardware. If the bit was cleared then the FIFO is flushed,

if not then software must flush the FIFO by clearing the record enable (RE)
bit.

dsptristate(dspxmit,dsprec);
This function is used to tristate the DSP from the data matrix.

gpio(mode,data);
This is used to communicate over the General Purpose I/O on the DSP connector.
Only the low order three bits are used. The rest are reserved. This call,
depending on the mode, can be used to set the direction of the I/O bits, read
the bits, or write the bits.

devconnect(src,dst,srcclk,prescale,protocol);
This function is used to attach a source device to any of the destination
devices in the matrix. Given a source device, this call will attach that one
source device to one or all of the destination devices. This call also sets
up the source clock and prescaler, protocol and protocol source if used.

sndstatus(reset);
This function gets the current status of the codec.

buffptr(pointer);
This function returns the current position of the play and record data buffer
pointers. These pointers indicate where the data is being read/written within
the buffers themselves. This function is also used to determine how much
data has been written to the record buffer. See buffoper().

The above is not yet complete. Atari has also routines for
JPEG and andio conversion.

>I worry about this though - the DSP is 24 bits and the 68030 is 32 bits
>so there's plenty of room for Atari to screw up...
>
For anyone who hasn't seen the latest AEO, the Falcon appears to
have been design as a 24 bit computer, partly to maintain compatability
with existing software. This doesn't mean third party boards etc can't
extent that, but it explains the 14 meg memory limit. The other captures
from Jim Allen posts to GEnie say that the Falcon chips all seem to talk
at 16mhz. Another poster mentioned here that there's an 8bit processor to
dsp channel, I guess for uploading code into the dsp, though I don't
know if that means you can't tell the dsp to load a program from a memory
location itself, which would be faster, I'd guess.
Motorola says the top speed the 56001 is clocked at is 33mhz, so the
ad/da converters must be the parts clocked at 50mhz.

clint@artech.UUCP (Clinton Keith) writes:

>The adc/dac channel is driven off the DMA clock, which is driven off a
>sub-divided horizontal scan rate. The 525 scan line rate sub-divided
>by 12, 24, 48 and 96 give the 6250, 12500, 25000 and 50000 bytes per
>second DMA/CODEC rate. This is the same as the STE/TT.

In the very techie "test" of the Falcon in the German C'T you can read a
differend story:

"[external/internal clock, prescale 4-24 or 128]. Internally there is a
27.175MHz clock to select the for the STe known sampling rates of
12.5KHz, 25KHz and 50KHz, or 32MHz in order to use the full bandwidth of
the memory transfer, with an sampling rate of 62.5KHz on eight 16bit
channels. This is also the upper limit for the external clock."

(if the about dosn't make any sense then it is probaly because my german
is even worth than my english)

6693. Atari STE Floppy Controller Info

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-12 10:50:52 UTC
From: simonc@jumper.mcc.ac.uk
Message-ID: <3ch9uc$2su@yama.mcc.ac.uk>
Source record: 28575

Does anybody out there know anything about a chip I've heard of called the Ajax chip? If so, where can I get technical documentation / supplies of these chips from? Any ideas? All I know is that it's a disc controller chip compatible with the WD1722-02 floppy controller as used in the original ST, and it can also handle high density (1.44Mb) disks...

Email replies, or here in this group would be much appreciated.

Thanks in advance,
Si Cooke
(Email: simonc@jumper.mcc.ac.uk)

I've just got myself NVDI 2.5 and tried it with TruePaint on my TOS 4.04 Falcon. It bombs out !! Arg!

Has anyone else had this problem cos I am sure I would have heard about it if somebody else did.

I've tried all the usual stuff - not running acc's or auto folder stuff and the rest - and I've also messed around with the NVDI's settings.

Oh dear....
Phil.

: text.

: I don't think there's a way to put text in the fileselector in TOS 1.02, but
: I may be wrong with regards to UIS...

If you are using Lattice C then you can use fsel_exinput no matter what TOS you are using, they have their own routines I think.

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on

which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after
uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys,
xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh,
xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to
another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available
at your site. If you don't, ask your local system operator how to transfer
files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for
"low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from
disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

- -

OOOOOPS!!! I forgot to sayy that it only bombs out in True Colour mode.
It works fine in other resolutions.

Cheers,
Phil.

MagiC 3 indeed sounds promising. What i would like to know is, how many
users are there of MagiC vs Multitos ?

I've had a few problems with NVDI 2.5 too - the GFA Interpreter gets very
upset when NVDI is installed, and there are a few other programs too
(Lattice C, Logic, to name but two). Maybe an NVDI 3 upgrade is in order...

No problems with NVDI + Lattice here... In fact Lattice 5.6 includes
(undocumented - gotcha!) bindings for some NVDI-specific calls.

6703. Vortex 386 SX card for Mega Ste

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-12 15:18:43 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <D0pEJ7.3EK@freenet.carleton.ca>
Source record: 28589

Has anyone any experience installing this card? In the Mega Ste, is it a very involved process, or does it just require a few jumpers, solder connections? I could get a card, but I will have to arrange installation here in Ottawa, Canada. Any help/comments would be appreciated.

also, what about installing an AT speed C16 in a mega ste? Is it harder/easier than the Vortex card, or is it about the same? Does it work well?

thanks!

Ehmm, if you want things to work in other resolutions than standard ST:

char *screen=malloc(hor_res*vert_res/n_bitplanes), *screen2;
screen2=screen+256-...
```

hello all !

i am using a 210 mb scsi hard disc since some years. this hd is buildin in the megafile 44 case with scsi id 1. years ago i did create 7 partitions. some days ago i tried to format and partion again. but now i am not able to format with the original old atari tools neither with the new one version 5.0.x of hdx. i tried with subfmt version 1.3 from year '88 but i could make only 4 partions. more then 4 partions is not possible.

any ideas ?
is there any other better hd-tool available ?

This is a known problem in true-colour mode only. This is due to some
disagreement between the two companies on how true colour mode should
work. Apparently, selecting TOS compatibility in NVDI _3_ solves this
problem.

Richard MORRIS (richard@stingray.manawatu.gen.nz) wrote:
: I was just wondering after seeing all the posts about 040 boards for the
: Falcon...

: Why aren't they making an '060 board for the Falcon instead??? I don't
: know the specs of the '060, but if it's out - why don't companies drop
: any '040 board and work on an '060 board?

A '040 board will definately be cheaper than a '060 board, and thus
appeal to a bigger market.
A '060 board isn't a bad idea, but something that will have to wait for
most developers until thay have made a 040 board.

: I guess that the data lines will probably be 64 bit instead of 32? (This
: is just a presumption). Would that create problems with current Falcons?

No, all 680xx processors have adaptive datawidth. They can accept any
memory size from 8 bit up to 32. (Don't think 060 is 64 bit)

: Or is it that the '060 chip is more expensive than an '040? I don't think
: this would matter as if you are going to buy an accelerator board, surely
: most would go for an '060 as it is bound to be faster than any '040 (unless
: someone made a _serious_ mistake).

Motorola haven't sold so many 060's, (compared to 030-040) and is
probably very expensive compared to them.
060 is faster, but I wouldn't fork out the money for it. To expensive and
I don't need the power.

Regards, Tommy

jyoung57@delphi.com wrote:
> I have the 1985 motherboard w/4 meg, Overscan, AdSpeed, ATKey, etc, but
> I haven't been able to collect enough information for this Blitter
> upgrade.

In the blitter's heyday, a few companies here in Germany offered
blitter upgrades for old STs, but I don't know about any publicly
available upgrade docs. If the reason why you want a blitter is
graphics speed in your standard applications, then consider
a software graphics speeder (NVDI, what else 8-) instead. It is
much more effective than the hardware blitter alone. If you want
a blitter for things like special effects in games, it might be a
different story.

> appropriate... now if Atari CAN conform to "standards", thats another issue :-)

Atari hasn't been that bad concerning standards as most people think.
When the ST was released, GEM was about to rule, even in the PC
world, so this actually was a kind of a standard. The DOS filesystem
which TOS uses definitely is a standard, and it has helped us
Atarians a zillion times when transferring data. The ACSI port
is a kludge, but at least it allowed us to connect stock SCSI
disks later, allowing everyone to shop around for the lowest
prices. The same goes for those darn IDE disks in the Falcon 8-)
When the ST was released, both the standard parallel and serial port
were not always common in PCs, you had to add them.

In short, standards avoid adapter kludges and allow you to shop
around and therefore are A Good Thing. OTOH, I'm definitely not
religious about standards. Much of the excitement in the early
Atari days came from being slightly non-standard 8-)

So MagiC 3 allows a program to wait for "an AES event or an IO event"?
(ie integrates evnt_multi and select?) That's what we were previously
talking about here, iirc.

Sure, all you need is a standard parallel printer cable. In order to use the
printer from your applications, you will need the appropriate printer driver
software, of course.

>seems that this kernel doesn't like the Atari's Control Panel and other
>accessories.
Not all accs do load up. Do you mean the CONTROL panel or XCONTROL panel?
The XCONTROL panel sometimes doesn't load due to one or two rogue CPX files.
I have many CPXs and the only one that causes the XCONTROL not to load is
ENV.CPX.
Try going through all the CPXs to eliminate the culprit.

You can also try lading ACCs from the desktop after boot up, they should
appear in the Desk menu.

Also, do you have the following lines in GEM.CNF?
setenv ACCPATH=C:\
setenv ACCEXT=ACC,ACX

```
>const int SCREEN_SIZE=32000;
Can all you people talking about mallocing screen memory and screen sizes
please note that a screen is NOT necessarily 32000 bytes big. There is
Overscanned screens, TT and Falcon screens to allow for.

Get the correct screen size (and other useful bits):

handle = (short)graf_handle(&wchar, &hchar, &wbox, &hbox);
v_opnvwk(work_in, &handle, work_out);
screen_lines = (work_out[1] + 1) / hchar;
screen_width = (long)work_out[0] + 1;
screen_height = (long)work_out[1] + 1;
aspect_ratio = work_out[4] / work_out[3];
font_ratio = hchar / wchar;
colours = work_out[13];
palette_size = work_out[39];
vq_chcells(handle, &rows, &columns);
vq_extnd(handle, 1, work_out);
backcolours = work_out[1];
planes = work_out[4];

screen_size = ((screen_width * screen_height) * planes) / 8;

Please write compatible code. The market is small enough as it is - you need
to make any program you write work on ALL Atari TOS-based machines.

Bigger market???? Two times zero is still zero. I'd bet the main
reason there are '040 boards as opposed to '060 boards is that '040
boards have been implemented on other platfroms for much longer and
thus it is cheaper to reverse engineer an existing design than to
start from scratch.

Very easy... Pick out your 68000, put it in the socket on the 386 sx card
and plug the card in the 68000 socket in your MEGA STE and you're ready !!

No soldering, no patching, no straps that need to be moved !!
I've had my card a while now, and it works very very well !!!

6727. Why should I buy a Falcon?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-13 20:30:54 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELOIBBVGUp@stingray.manawatu.gen.nz>
Source record: 28460
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

If I went out and bought a Falcon today,
what else would I have to buy with it?

Everyone seems to have accelerator boards - would I need to buy one as well?

Should I use a TV or SVGA monitor or even RGB monitor? I would like a
standard PC-equivalent resolution of 1024x768x256 colours (all my friends
have this from scratch, so it's no big thing).

From what I have heard, it appears that IDE drives are effectively faster than
SCSI in Falcons - so would I be better off getting a 540 Meg IDE?
I also hear that the Falcon has a 2 1/2" drive instead of the "standard" 3 1/5"
But I can fit one into the Falcon by removing the internal speaker?
It has an internal speaker then I presume? What happens if I remove this?
Would I lose any specific sounds? Or was it just put there in case you bought
a SVGA monitor without sound? Would I need to hack bits off the computer to
get this drive in?

Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),
and more RAM ?

The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?

I realise I would be stuck with the keyboard attached to the computer *sigh*,
but understand that the keyboard is much better than the ST I am using now?

So basically, I would like to know:

Just what would the cost be, after I cover all the hidden (but necessary) costs
of buying a Falcon? I would dearly love to buy a Falcon, but if it is going to
end up costing the same as a PC (I can get an Intel 486 dx2/66, 8 Meg, 540 IDE
enhanced, SVGA monitor 1Meg video ram VESA[or something], soundblaster 16 bit
stereo, plenty of software free, Borland C++ for the student price -a third
of the standard retail price] - forgive me if I have missed anything).
Oh the computer is a Compaq Prolinear btw. (so it's not the cheapest PC).

The PC above would cost (last month's prices): $NZ3800 (about $US2400)
A Falcon (4 Meg and _NO_ HD, _NO_ monitor...): Approx.$NZ2100 (about $US1324)
not far off 1/2 price, but that's without a 540Meg HDD ($NZ500 - $US315),
a monitor (not too sure of the cost), and a whole bunch of software - C,
an Assembler for the '030 and DSP) and any GFA Basic update for the Falcon.

Oh yes, and cables too - some monitor cable to attach a Monitor (SVGA or RGB)
to the Falcon (at least I already have a SCART for a TV) - they usually cost
a fortune.

And ignoring the fact that there are a _lot_ of PC dealers in New Zealand - but _no_ Atari dealers - this is vital if I want to see software b4 I buy it rather than having to try get hold of an illegal copy, just so I can preview it before actually buying an official version from overseas!!!

I'm not trying to convert people to PCs (else I'd be saying this in .advocacy) as I myself _love_ ataris. But the problem is - is it really worth buying a Falcon? Please give me reason to buy one (next year when I have the money).

Thanks for reading all that,
Richard.

PS. Before anyone says it - yes I would have to pay more for a PC with MIDI, and a LAN - but I would never actually use those, so they don't really count.

From: npetrlik@public.srce.hr
Message-ID: <3cl3ue$2ce@nippur.irb.hr>
Source record: 28462

Hi !

I have a MEGAFILE60 (ACSI), and for formatting and
partitioning I've used HDX 3.02. Before I've partitioned the
hard disc, HDX asked me to choose which partitions should
be eXtended (I choosed E,F and G, i think - BTW, i
partitioned him to partitions from C to H). Is it somehow
possible to avoid that eXtended GEM partitions choosing, or
is it possible to make only one eXtended partition ?
Not a trouble to me, but when using Spectre to make Spectre
partition, eXtended GEM partition Spectre recognizes as
only ONE SINGLE partition! ...
One more thing, all of my partitions are smaller than
15 MB and my TOS vers. is 1.04 (rainbow TOS).
Maybe other partitioning program could handle this ?

Thanx for the answers.

Neven Petrlik npetrlik@srce.hr Zagreb,CROATIA

>
>No, all 680xx processors have adaptive datawidth. They can accept any
>memory size from 8 bit up to 32. (Don't think 060 is 64 bit)

Actually the '040 can only handle a 32 bit bus according to what I've read
about it. The '060 is most likely the same.

>Motorola haven't sold so many 060's, (compared to 030-040) and is
>probably very expensive compared to them.

Well, right now the '060 is certainly more expensive, but I read somewhere
that they actually expected the chip to be cheaper to produce than the
'040, which could be nice...

Even if the '060 is pin compatible with the '040, it won't be possible to
simply plug it into an '040-accelerator card since they've lowered the
supply voltage to 3.3 (or was it 3?) volts.

True so true!

>A '060 board isn't a bad idea, but something that will have to wait for
>most developers until thay have made a 040 board.

And until the 060 is out on the market! (Is it out?)

>No, all 680xx processors have adaptive datawidth. They can accept any
>memory size from 8 bit up to 32. (Don't think 060 is 64 bit)

Hmmm not true!

000, 010 does not have adaptive datawidth!

020 and 030 does!

040 and 060 has it, IF you are using a external chip called: 68150

the 060 CPU has 32 bit wide data/address bus!

>Motorola haven't sold so many 060's, (compared to 030-040) and is
>probably very expensive compared to them.

I think Motorola had to rethink when APPLE said that they wouldn't have
any use of the 060, instead they consentrated on the PPC!

Still the CPU market for Motorola is quite small relative to other parts
of Motorola products!

>060 is faster, but I wouldn't fork out the money for it. To expensive and
>I don't need the power.

What! You always need POWER! (But if it's worth the money? Don't know!)

Depends what you are writing. For a lot of programs I would absolutely agree with you. The program I am working on at the moment, however, is a game which (on a 'standard' ST) is stretching the machine pretty much to its limits. All the graphics are done by my own assembler routines, because this is much faster than using the VDI or linea. Part of the reason they are faster is because I have decided to restrict the program to 16 color 320x200 mode (ST low resolution). I think most (all?) Atari machines can handle this, and the restriction allows me to make a lot of optimisations which would not be possible if I couldn't hard code things like the screen width and the number of color planes. How many games/demos do you know which will run in ANY screen mode?

If I was writing a word processor things would be different, but then I would not use Setscreen() at all becuase MultiTos and MagiC probably don't like programs messing with it very much :-)

The 68060 has a 64-bit data bus, though it is still a 32-bit processor (just as the Pentium and PowerPC 601 have 64-bit data buses but are 32-bit processors).

Just get them to join comp.sys.atari.st[.tech] and look at the "dream atari"
thread that "someone" started.

In fact - perhaps they could give us an e-mail address and I'm sure that quite
a few people would be able to send them some hints as to what to include. It
would make their life easier - they wouldn't need to think of things to put in
it - we'd tell them instead =8-]

Richard =8-]

PS. Why 040??? There _is_ an '060 - the first mistake they could make would
be to use "old-tech" from the word go.

: T36 acclerator for the ST. The T28 I have here for over a year now has been
: rock solid and cost just under 200 quid. Get NVDI or Warp ontop of that and the
: whole thing really flies :-)

: Compatability , well some games don't like it but it can be switched off.

: Powerdos/datnet cartridge networking solution doesn't like it unless I switch
: the cpu cache off, it does not bomb just does not see the other machines on the
: network, The cache can be turned on/off on the fly so its no big hassle.

Instead of the T36 System Solutions will do the PAK68/3 which does not
cost that much more - but gives you full 68030 compatibility allowing
you to run most TT or Falcon (Non DSP) stuff. There is also a socket
for an FPU and the option to use TT Ram. Speed is normally 33 MHz but
can be increased to about 50 MHz if you are lucky. I am also told that
you can plug your old 68000 chip onto the board for using those old
games..

Beric.

Atari GDOS can't do that but the CodeHead one Can, G Plus Plus or some thing like that, it has a ACC so that you can load the Fonts when you like...

But I am not 100% on this, may be some of the USA readers can help...

No, but modern GDOSes don't load all the fonts at once with the call,
so why not just use vst_load_fonts()?

The bitmap font format is the same as the Line A font format which is
the Atari Library manual, IIRC. You could hack something up to load
these into memory yourself and blit chunks to the screen.

It's not as if designing for the Motorola 68K family is difficult. The CPU's are much better designed than their Intel counterparts, so designing with them is that much easier.

Reverse engineer someone elses design? Why?

Nope, the reason for a 040 accelerator is simply that the 060 is to bloody expensive to buy at the moment (and may remain that way as Apple aren't using it as they have in the past).

From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3cn1un$htg@whitbeck.ncl.ac.uk>
Source record: 28487

I'm currently porting the xvt xterm replacement to X11 for MiNT,
and have come accross some problems - but not where I expected them
(the Xlibs are in a very early state). The problem seems to be in the
MiNT libs - eg. tm=time(0) or time(&tm) both cause the program to
crash with a bus error. I'm using pl44 libs and compiling with GCC2.3.1
using a 1.11h2 kernal compiled with the same libs as I'm compiling
xvt with.

(The Xlib stuff seems to work ok mostly, but the mintlib bugs keep killing
off xvt as soon as the Xwindow opens.)

Help......

Craig.

PAK68/3 is IMO the best thing for the Atari but the 030 version does need
a TOS 3.06 *PATCHED* while the 020 only needs a normal TOS 2.06.
BTW, you can have a PAK68/3 board with a 68020 at 32Mhz if you want.

6759. TT RAM

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-14 16:42:36 UTC
From: David L Watson <dw4g+@andrew.cmu.edu>
Message-ID: <Yivm1wK00WB7E9_5pY@andrew.cmu.edu>
Source record: 28490

I'm looking into buying more RAM for my TT and was wondering what kind of hardware I'm going to need. I bought the machine with 4M of ST RAM, of which it appears that 2M are origional and 2M are added on. I'm assuming that I'm going to have to buy a expansion board for the TT ram. Does this go in a different place then the ST ram or am I going to have to remove the ST ram expansion board? Also, what kind of simms should I be looking for?

Thanks,
David

Message-ID: <3cnbcl$kmv@whitbeck.ncl.ac.uk>
Source record: 28493

HiSoft products do tend to have problems under some configurations - esp.
if NVDI is there as well. One problem which is consistent for all their
softs which we have tried is that the editors corrupt text when used
under TOS1.6 if NVDI 2.5 is loaded as well. This happens on Basic2, Devpac2
and LatticeC 5.56. Consistently - remove NVDI and all is well. Use a different
TOS, and all is well, just the 1.6 + NVDI combo triggers the problem.
This is not related to the TC problem, as I was running in ST-High on
a 4Meg STE.

Also, HiSoft's cascaded menu's cann't be selected under TOS4.02 (in
HiSoft Basic & Lattice 5.52) - but they do work under TOS4.92....
(this on my Falcon).

Craig.

Yep you'll need a TTRAM card that takes SIMMs, this will be additional memory
to the 4meg STRAM you already have and will plug into a socket next to the
030 cpu. For simms it'll probably depend on the make of card you get. I have
the MegTT card from Catch Computer (German) which uses 8 * 1,4 or 16Meg 30pin
simms for 128Mb max. speed wise i have 70ns, which is minimum for my card
without adding wait-states, which is pointless if your spending ��� upgrading
to TTRAM.

I remember when Apple was starting to come out with 040 machines a few years ago. The first 040 Macs rolled out the door about 2 or 3 years after the 040 came out. There was alot of furor over that, because of course Mac users expected Apple to be able to come out with 040 Macs as soon as Motorola came out with 040's.
The problem was not with Apple, but with Motorola. Apple needed quantities in the hundreds of thousands, and Motorola simply couldn't produce that many 040's cheaply or reliably enough for Apple. It took them a couple of years to get their production lines to the point that they could make that many 040's. I expect that they will have the same sorts of problems with the 060. There are, of course, buyers for the chip, and Motorola, citing one example, has 060 VME boards, but these cost several thousands of dollars and are for very specialised applications. The 060 is not a mass-quantity item yet, and if that kind of demand doesn't exist, Motorola probably won't take the trouble to tweak the production lines to handle it.

Hi, I've heard there is a thing called a 68001 co-processor chip.

Is it possible to put one in an ST, and if so, what difference will it make ? I have a friend who uses his ST for MIDI stuff and he finds that when getting it to produce music scores on complicated parts, the ST gets very slow. He has been thinking about getting a 28MHz accelerator board, but that's very expensive, so would such a co-pro help here ?

Cheers,

Kev.

6767. Adapting STfm keyboard to ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-15 06:46:11 UTC
From: fsctc@lerc.nasa.gov
Message-ID: <3coonj$grb@flame.lerc.nasa.gov>
Source record: 28499

I'm trying to adapt a STfm-style keyboard for my ST. This replacement has only the 8-pin plug, with pin-2 blocked out as key. However, it keeps on clicking, indicating something's wrong. Here's what I make out the pins to be:

pin Item old ST J12 pin
1 GND 1
2 NC 2
3 floppy light
4 +5V 13
5 RX 14
6 TX 15
7 Reset 16
8 ? Is this necessary? 17?

Sam's Photofact shows pin 17 on the old harness goes to pin-5 of joystick 1. Is this critical?

Clarence

Pin number 8 has a wire, but do I need to hook it up?

6768. AT_Speed upgrade with Make-it 486 plugin

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-15 06:49:32 UTC
From: Bent Meyer <meyer@u.washington.edu>
Message-ID: <Pine.A32.3.91c.941214224021.83026C@homer15.u.washington.edu>
Source record: 28500

I have a 1040ST with an AT_Speed card mounted on top the ATARI 68000 chip, which in effect gives me a 286 16 MHz PC when I elect that mode. It works great. For me a pretty good way of being compatable with some chores done at work.

I discovered a PC catalog which advertised a 486 upgrade path for 286 PC owners. The add suggests a doubling of processor speed from 16 MHz to 32 MHz and onboard Co-processor.

You have probably anticipated y now my question. Can I remove the 286 CPU from the AT-Speed board and replace it with the 486 board? Yes, this would mean a board on top of a board. And, yes I can create the additional room needed. Can this be done? Has anyone tried it?

The add claimes, a 286 PC owner simple pulls their 286 our and plugs the 486 board in the the empty carrier. No jumpers or setting need changing, simple "plug it in and go!"

So what do you think?

Installing the card ist just plug and play. You've got totake out the
68000 from its plcc socket, plug in the card and plug the 68000 in a
socket on the card. Nothing more. I doubt that there are revisions of
the Mega STE board where the processor is directly soldered to the board. :)

^^^^^^^^^^^^^^^^^^^^

As long as you like interlacing and/or lower refresh rates. As I recall,
the crucial thing is that the system can give the video controller
something like 24 MB/s of total bandwidth, no more. You also get a system
slowdown at higher resolutions: the memory bus is contested more by the
video controller in high bandwidth modes.

Any cheap (under $150) SVGA card worth its salt should be able to handle
1024x768x256 at 60 Hz noninterlaced or better, a resolution which the
Falcon is incapable of even with the ~$100 hardware res-enhancers.

The cookie jar would be a good way, although it isn't there as standard on some older TOS versions.... (Available as standard from TOS 1.4 I think)
Theres a cookie for Machine type, There may be one for processor type.... I'm not too sure about that one (although the FPU cookie will say if an 040 is present)....

There are more details in most of the Atari reference guides...

It's no question of luck anymore. They changed the GAL-equations which
now allow 50 MHz with nearly every ST. And for the rest they developed a
small buffer-pcb which 'isolates' the fast PAK-side of the bus from the
slow ST-side. This one is also neccessary for the TT-RAM- (fast-RAM-)card,
called FRAK and for some graphic-extension-cards.

> you can plug your old 68000 chip onto the board for using those old

6789. Software For Videotex Decoding

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-16 18:44:09 UTC
From: npetrlik@public.srce.hr
Message-ID: <3csn5p$dln@nippur.irb.hr>
Source record: 28518

Is there any programs for videotex decoding ?
If is, where can I find them .. ftp ?

Bye, and thanks.

6790. Power supply pinout

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-16 20:45:58 UTC
From: boyd@gauss.math.fsu.edu
Message-ID: <3csua6$b66@mailer.fsu.edu>
Source record: 28522
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have obtained a really old 520ST, the type with no internal floppy drive or power supply. For the latter, there was a "power brick" thingie that plugged into the wall and the back of the computer. Unfortunately, I do not have that power brick. It had a round female connector with about 4 pins in it.

Does anyone have a pinout diagram for that power brick? I could probably cobble something together if I knew which pins needed what voltages.

Of course, if anyone has an extra power brick like this for sale, I'd be interested as well.

Please email responses directly to me. Thanks much in advance.

6791. Path for CLIPBRD... Help !

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-16 21:36:08 UTC
From: npetrlik@public.srce.hr
Message-ID: <3ct188$ens@nippur.irb.hr>
Source record: 28523

I'm using 1st Wordplus 3.20, and i'm
interested is it possible to set the
path for Clipboard to C:\CLIPBRD ?
Cause dummy 1stW. saves CLIPBRD dir
in the current directory ..
although in the WORDPLUS.PRG file
stays C:\CLIPBRD ...
But hear this:

All the prg's use clipboard path
C:\CLIPBRD (if hard disc is present),
but:
I start a 1stWord+, use a clipbrd,
then use a LZHSHELL, use a clipbrd,
and LZHSHELL think the clipbrd is
in the dir. where 1stWord+ put his
clipbrd ! (D:\TEXT\1STWORD\CLIPBRD) !
So, I was thinking, maybe some sys
variable, or a short assembly prg
could handle this ?
Maybe in desktop.inf ?

I'm using Teradesk 1.40, my
TOS version is 1.04 (1040STFM),
and i have a MEGAFILE60.

Please help!

Thanx.

There is something like this on one of the Atari CD-ROMs I have. Curiosity
value only AFAIC. It doesn't allow you to use 68030 only software on an
ST.

Which is why rushing out to buy a Apple PowerMAC is not necessarily the
good investment it might look now. IMHO in a couple of years from now there
will be a standard for PPC machines, and anything that doesn't comply
might as well not have a PPC chip in it at all.

A well designed 040 accelerator is going to blow the Falcon (and TT for
that matter) away anyway. I'd be surprised if many Falcon owners could
afford to buy a 060 accelerator. I'm sure many of them would consider it
just *too* expensive.

> is pointless if your spending ��� upgrading to TTRAM.

Interestingly enough I have 100ns SIMMs in mine and never had a problem.
Its considerably faster that the ST RAM on board.

In my TT I have:

Atari ST RAM board with 2Mb 100ns
GESoft Mighty Mic 32B with 2Mb 100ns and 2Mb 80ns

I've had another 4Mb of 100ns in the GESoft board without problem either.

OTOH its worth buying fastish RAM as you never know what you might end up
needing it for.

:-)

> help here ?

Software needs to be written specially to use a co-pro. It is very unlikely
any midi software would use a co-pro as AFAIK midi software does not make
much use of floating point maths.

A CPU accelerator is generally a better bet although not all midi software
is happy on an accelerated machine.

Richard MORRIS (richard@stingray.manawatu.gen.nz) wrote:
: If I went out and bought a Falcon today,
: what else would I have to buy with it?

: Everyone seems to have accelerator boards - would I need to buy one as well?

No, not immidiately anyway. A 16 MHz 68030 is roughly 4 times as fast as
an 8 MHz 68000. Personally, I would like an accelerator (who wouldn't),
but so far I haven't seen any that appeal to me. (price, FPU, FastRam)

: Should I use a TV or SVGA monitor or even RGB monitor? I would like a
: standard PC-equivalent resolution of 1024x768x256 colours (all my friends
: have this from scratch, so it's no big thing).

I use both a VGA and an RGB. What you need/want is the key issue here.
VGA: Nicer display (fot your eyes), in some ways higher resolution and
some nice software demands VGA.
RGB: Not so nice display, in other ways higher resolution
(overscan/truecolour), and some nice softs demands RGB.

Best would be if you could get hold of an multisync that could handle
both VGA and RGB signals.

: From what I have heard, it appears that IDE drives are effectively faster than
: SCSI in Falcons - so would I be better off getting a 540 Meg IDE?

Maybe, I'd prefer a SCSI though.
IDE: faster throughput, limited to one 2.5" IDE, unless you get a tower,
faster booting than a SCSI.
SCSI: Slower, more drives. boots slower than IDE. (There is a hack that
corrects that though)
I'm not 100% sure that SCSI is indeed slower than IDE, but it sure looks
that way.

: I also hear that the Falcon has a 2 1/2" drive instead of the "standard" 3 1/5"
: But I can fit one into the Falcon by removing the internal speaker?

Don't think so. Unless you get a tower for your Falcon.

: It has an internal speaker then I presume? What happens if I remove this?
: Would I lose any specific sounds? Or was it just put there in case you bought
: a SVGA monitor without sound? Would I need to hack bits off the computer to
: get this drive in?

Nothing. I've removed it without problems. It's no good anyway, I'd
recommend that you remove it in any case.

: Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),
: and more RAM ?

NVDI is very nice, I'd recommend it to anyone getting an Atari.
4 meg RAM is sufficient. 1 meg is unuseable. 14 meg very nice.
Get a four meg Falcon, and if you get a accelerator, get some fastram.

: The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
: Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?

Falcon has it's own memory-cards. But there are a lot of third-party
simmcards around that you can buy. (100-150 USD is an estimated cost)

: I realise I would be stuck with the keyboard attached to the computer *sigh*,
: but understand that the keyboard is much better than the ST I am using now?

Basically, it is the same keyboard. You can get a detached keyboard from
a Mega or TT and use it with your F030. I've done it.

: So basically, I would like to know:

: Just what would the cost be, after I cover all the hidden (but necessary) costs
: of buying a Falcon? I would dearly love to buy a Falcon, but if it is going to
: end up costing the same as a PC (I can get an Intel 486 dx2/66, 8 Meg, 540 IDE
: enhanced, SVGA monitor 1Meg video ram VESA[or something], soundblaster 16 bit
: stereo, plenty of software free, Borland C++ for the student price -a third
: of the standard retail price] - forgive me if I have missed anything).
: Oh the computer is a Compaq Prolinear btw. (so it's not the cheapest PC).

Depends on what you want. A Falcon 030 4/0 (4 meg no hardrive) is almost
a complete computer. What you would need is a Harddrive and a monitor.

: The PC above would cost (last month's prices): $NZ3800 (about $US2400)
: A Falcon (4 Meg and _NO_ HD, _NO_ monitor...): Approx.$NZ2100 (about $US1324)
: not far off 1/2 price, but that's without a 540Meg HDD ($NZ500 - $US315),
: a monitor (not too sure of the cost), and a whole bunch of software - C,
: an Assembler for the '030 and DSP) and any GFA Basic update for the Falcon.

: Oh yes, and cables too - some monitor cable to attach a Monitor (SVGA or RGB)
: to the Falcon (at least I already have a SCART for a TV) - they usually cost
: a fortune.

You should get one adaptor of your own choice for free with the computer.
Some dealers would want to charge you extra for that, tried it with me.
I declared it a greedy attitude and started to go. I ended up with one
for free. (It doesn't cost very much, maybe 30 USD tops)

: And ignoring the fact that there are a _lot_ of PC dealers in New Zealand - but
: _no_ Atari dealers - this is vital if I want to see software b4 I buy it rather
: than having to try get hold of an illegal copy, just so I can preview it before
: actually buying an official version from overseas!!!

: I'm not trying to convert people to PCs (else I'd be saying this in .advocacy)
: as I myself _love_ ataris. But the problem is - is it really worth buying a
: Falcon? Please give me reason to buy one (next year when I have the money).

Reading all your arguments. I would recommend you to buy a Falcon 4/0
with an RGB-adaptor, and use it with your scart-TV.
Get an external SCSI-drive. (costs a little more, but I prefer SCSI over IDE)
Then, if you have the money, and wish to obtain a VGA-monitor, get it!

Another point is that if you get a SVGA, there's nothing stopping you to
use it with a PC if you decide to buy one at a later point.
(It would lower the cost of the PC). Same goes for simms if you decide to
get one of those simm-cards and so on.

I bought my F030 for the only reason that I like Atari. (I've got a 486
DX2-66 as well). But I've carefully configured my Falcon (and even spent
more money than really needed) to get hardware that I know will be
useable even if I decide to get another computer. (PC/MAC/whatever).
I see that as an investment for the future.
Most of my stuff I can use both with my PC, and my F030. Like harddrives,
monitors, CD-rom, memory, laser-printer, etc.

Anyway, if you like Atari, there is no real reason not to buy it.
Unless, of course, you don't have the moeny, or there is something you
have to be able to do, but can't with an Atari.
Before you decide, think about -why- you like Atari, is it because of the
OS? Easy to program? Any special programs you like? etc
I've got loads of reasons why I like Atari, and even got some as to why I
like PC. There are things I don't like with both. (They do complement
eachother pretty good)

Still, I like my Atari the most, and use it atleast 5 times more than my PC.

Just my opinion!

Regards, Tommy

: @CiX

I spent some time at a Motorola office here in San Diego, CA. I was told
that the 060 is not very much more than the 040 price wise. Therefore,
there is really not much problems in getting the 060 in place of an 040.
The 060 is bus compatible with the 040, so the 040 type upgrade would be
needed in order to run the 060. This is where the real expense would be,
no the cost of the CPU.

Motorola rules.....

Actually the PowerPC has two versions of its architecture: 32 bit and 64 bit.

The currently available chips (601, 603, and 604) are all the 32 bit
architecture (32 32bit general registers and 32 64bit floating registers
^^^^^^^^^^^^^^^^^^^^^^^^^^
with a 32 bit effective address, a 52 bit virtual address, and 32 bit
physical address.

The only chip announced so far that implements the 64 bit architecture
(the 620), isn't available yet. It DOES provide 32 64bit general registers
and 32 64bit floating registers with a 64 bit effective address, an 80 bit
virtual address, and a 64 bit physical address.

So while the PowerPC does have a 64 bit version of its architecture, MOST
PowerPCs that will be sold will be the 32 bit architecture.

Use xmodmap to modify the KEYCODE to KEYSYM mapping. xmodmap is
available on phlem.ph.kcl.ac.uk in clients2.tar.gz. Remember you
cannot use the Alternate-Key as ModeShift, so it's not possible to use
@[]{}\ on the braindead German keybord (ever tried to type ^\ under MiNT?).

Someone wants to get my German TT keyboard and a set of German TOS
3.06 EPROMs and give me a US-TT-Keyboard and an US-TOS 3.06?

Bye,
Knarf

I know you can use Gemview and Speed of Light to convert
J-Pegs, but what about JPEG5BIN..

But is the JPEG5BIN better, or do I get better results using
Gemview, or Speed of Light...??

I would like to convert them to what ever standard that works best
with Photochome 4 and a STE....

Does TARGA give better results with Photochome 4....

Thanks.....

You basically have a choice between MiNT (which is a BSD extension to TOS)
or Minix (which is a V7 *replacement* for TOS).

> May I get a complet version of this on a ftp-server ? and where ?

MiNT is free so is available by FTP. Minix is owned by Prentice Hall.

> Further on I like to run xwindows on tjhis machine. Does it works ?

Up until recently the answer would have been no. Unfortunatly its still
no in your case as 4Mb is not enough to run X without virtual memory. As
the standard ST is incapable of doing VM you will need a memory upgrade
(not cheap) or a TT or Falcon. Once you are at this stage then X is
available under MiNT, but its still early days yet for it.

Actually if you have a TT or Falcon then Linux/68k (as in Linux for the
PC) becomes an option. X is going to be available for this - but its early
days for this too at the moment.

Roland.

Message-ID: <787719004.1@mettav.exnet>
Source record: 28414

It was none other than "Mark Baines" that wrote on 13 Dec 94 that ,
>> seems that this kernel doesn't like the Atari's Control Panel and
>> other accessories.
"B> Not all accs do load up. Do you mean the CONTROL panel or XCONTROL
"B> panel? The XCONTROL panel sometimes doesn't load due to one or two
"B> rogue CPX files. I have many CPXs and the only one that causes the
"B> XCONTROL not to load is ENV.CPX.

I think that was fixed was it not ? I have Xcontrol loading alright and am
using ENV.CPX (I don't have version no. handy but it was the latest one)

"B> You can also try lading ACCs from the desktop after boot up, they
"B> should appear in the Desk menu.

he could also try renaming it to XCONTROL.APP and running at start up using
'exec'(?) or is it load <G> that way you can unload it aswell, .since most of
(mine anyway) CPX's are only initially needed to set up Colours , Background
Colours and some program/gem parameters this was a more economic use of it.
Then stick it on the desk to load it easily when required.

I've borrowed an Epromburner from a friend. Problem is that he has misplaced the software for the epromburner, and thus I can't use it.

It is an EP 16/512 from Rolf Rocke Computers.

Can anybody get me the soft?

All help appreciated!

Regards, Tommy

I have just had a play with JPEG5, gee what a problem to get it to run,
very bad Doc's...

Problem is none of the output files GIF/TGA will work with Photochrome 4,
do I need any more that 2 megs to use this program, the file JPG
that I was using was OK when converted with Speed of Light, and then viewed
with Photochrome 4...???

The GIF file that came from JPEG5 just locked up Photochrome 4, and the TGA
file just gave a garbled screen...

Any clues...???

NEON is a great new Raytracing program for F030 with full 3D studio,
shading and animation facilities from Team Computer, Germany. It supports
the 16-20 Mhz maths coprocessors and was demo:ed at ProTos with a full
blown 5 minute animation in Silicon Graphics style anti-aliased 24 bit
graphics. It's a lot faster than POV or Inshape and a "standard picture"(?)
is said to take ca 20 minutes to trace. You can order a full program disc
demo (- save option) for 10 DM from Team Computer, +49 221 466774 and the
animation video is 20 DM. You will get the money back if you buy the full
program. NEON is allready finished and Team Computer is currently putting
the manual together and working at distribution deals.
I've allready ordered my demo. By the way, who said there's no software
beeing developed for Falcon 030 ?

A new update is out for Cubase Audio. In the 2.02 version Charlie
Steinberg has taken care of a couple of bugs from 2.0 and 2.01 and also
added completely new sync options. The midi and Audio Engine sync is now
separated and with a S/PDIF-send capable synchronizer it is now possible
to achive true tape sync. The new features from 1.0 are to many to be
described here, but generally 2.02 makes a top of the line Digital Audio/
midi recording program with 8 and optionally 16 Audio Tracks and brilliant
midi sequencing. This is another *great* Atari program that 3:rd party dev.
/software houses keeps developing for Atari.

JPEG5 that I found on tu-berlin, does not work at all,
the GIF output file was stuffed, also you can't run it
from the desktop, due to the command line case bug, you need
a shell or Neodesk...

Was this case bug every fixed in TOS....??

I also ran the Julian Reschke port JPEG4, this produced
a working GIF runing from the desktop, the command line
is not the same as JPEG5, but I had to run JPEG4 from
the root as it could not find the files when in a directory,
unless you gave it a explicit path...

JPEG5 needs a > between the in/out file, JPEG4 does not...

So what is the lestest version of the JPEG source files,
and can some one do a port of them, what we need is the
LZH man Christian Grunenberg to do a port of it, then it will be
Fast....!!!

How about it chaps.... ??

Yes, convert the CJPEG/DJPEG.1 files to ASCII with MANASCII.TTP, that
should fix it.

>Problem is none of the output files GIF/TGA will work with Photochrome 4,
>do I need any more that 2 megs to use this program, the file JPG
>that I was using was OK when converted with Speed of Light, and then viewed
>with Photochrome 4...???

1) I'd use GEM-View to unpack JPEGs (to TGA or whatever you want) and only
use CJPEG/GIF2JPG (who introduced the latter, silly name?) to encode
JPEGs.

>The GIF file that came from JPEG5 just locked up Photochrome 4, and the TGA
>file just gave a garbled screen...

>Any clues...???

2) I guess either a faulty version of CJPEG/DJPEG has been used or
Photocrome 4 itself doesn't work properly. Try JPEG4 and retry, this one
definitely works. And if it doesn't: complain to the Photocrome
programmer(s).

SCSI slower???? 1.6 megs/second with a Quantum 240 LPS were verified last
year. It's certainly some wrong piece of information you present here.

>: It has an internal speaker then I presume? What happens if I remove this?

One needs external speakers (and an amplifier) in that case, though.

>: Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),
>: and more RAM ?

>NVDI is very nice, I'd recommend it to anyone getting an Atari.
>4 meg RAM is sufficient. 1 meg is unuseable. 14 meg very nice.
>Get a four meg Falcon, and if you get a accelerator, get some fastram.

I'd also recommend BlowUp or similar expansions. Best one seems to be the
Speed Resolution Card by Hard&Soft, but this one should be built in at
that firm (is it available in the U.S. yet?). It also sets the board
speed to 18/20 MHz and the CPU speed to 36/40 MHz (fan necessary, but
included). Some Falcons do not work properly with 20/40 (mostly Rev.B
boards, AFAIK), though. This _is_ the most expensive method (400,- DMs
plus 100,- DMs for service -> more than 300 US$s.

All the other res. expansions give less refresh frequencies, of course.
But BlowUp soft is and stays the cheapest solution, and also the hardware
expansions (SBII, BU Hard I&II, to name a few) are far behind the SRC.

>: The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.

Some of those have timing problems (monitor blips, etc.) if the wrong
SIMMs are used :-(.

>: I realise I would be stuck with the keyboard attached to the computer *sigh*,
>: but understand that the keyboard is much better than the ST I am using now?
>
>Basically, it is the same keyboard. You can get a detached keyboard from
>a Mega or TT and use it with your F030. I've done it.

You can also buy a tower case + MFII adaptor and use a clone keyboard
instead.

[PC vs. Atari]

I'd recommend the PC if it is just the money that you care about. If you
want MIDI/Recording or similar, I'd favour the Falcon. If it is some
special software package that you are interested in, buy the computer it
is available for.

E.g. JPEG/MPEG with DSP->Falcon, Cubase Audio->Falcon, Calamus->TT or
Atari clone (EPP in mind), not to mention all the Freeware/Shareware
packages available, but
Word->PC, Excel->PC, etc.

This update has been available for a few weeks now in ftp.mcc.ac.uk
(pub/cubase/UPDATES), as will all other dongle-protected updates.
In any case I suggest that people buy the update package nevertheless,
as in CAF 2.x there's a new score module, and the Score 2 book is
essential for getting the most out of it.

I love it too :-)

BTW. Have you subscribed yet to the Cubase mailing list:

Send Email to: majordomo@mcc.ac.uk, and write (to the first line only
without quotes) "subscribe cubase users email@address".

The list address (reply address) is cubase-users@mcc.ac.uk.

There are Atari-, Mac- & PC -users, and also Cubase programmers
(Stefan Scheffler, Wolfgang Kundrus) and support persons (Greg Ondo,
Bill Black) talking about Steinberg's products.

6822. RAM,FALCON & 040 cards

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-18 15:56:01 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3d1m2h$8pc@dux.dundee.ac.uk>
Source record: 28398

A number of people have told me that the only way to get fast TT ram
on the Falcon is to add an 040 card.

If I do this will I still only be able add memory to the card in
1,4 or 14mb increments or can I add say an extra 2/4/or 8mb ram to
the card.

If say I want to add another 2/4mb of fast TT ram to the card
how much will the card + ram cost me?

Yours

Rod

```

Well, I have used both 486 pc's (networked) and I own an Atari Falcon.
Once the falcon is up and running with a nice programme e.g Papyrus
you'll find the choice even harder. If however you MUST have
a powerful database the PC really is the best option. When its
up and running MS-Access wipes the floor in comparison with ST
database programmes.

If anyone can prove me wrong on this point, I'll be well chuffed!! As
I`d like to get a powerful GUI based relational database.

On the subject of price the PC's are without doubt better value but
if your prepared to invest a little more (you'll need a 4mb, HD falcon
SVGA and some progs) you'll get a fast, userfriendly and very
powerful machine. Which is without doubt better than any budget PC.

> possible to avoid that eXtended GEM partitions choosing, or
> is it possible to make only one eXtended partition ?

When you partition your drive AHDI compliant with more than 4 partitions there is always at least one extended GEM partition type which marks a sector that contains information about additional partitions.

> Not a trouble to me, but when using Spectre to make Spectre
> partition, eXtended GEM partition Spectre recognizes as
> only ONE SINGLE partition! ...

This is Spectres fault because Spectre doesn`t recognize the Atari compatible partitioning scheme although this scheme was introduced back in 1989.

> One more thing, all of my partitions are smaller than
> 15 MB and my TOS vers. is 1.04 (rainbow TOS).
> Maybe other partitioning program could handle this ?

Even HDX can handle this, at least current version, i. e. 5.04. Maximum partiton size is 512 MByte with TOS < 4.0 and 1 GByte with TOS 4.0 and MagiC.

>No, not immidiately anyway. A 16 MHz 68030 is roughly 4 times as fast as
>an 8 MHz 68000.

I wrote a program that alternated between number crunching and drawing
the results on the screen. I ran it on both a Mega STE in ST high rez
and a Falcon in ST high rez. The compiler did not optimize for the
68030 (probably 99% of Atari programs are written for the 68000). The
results? The Falcon was 19% faster than the Mega STE. So I would say
that the Falcon is closer to twice the speed of a 8 Mhz 68000 ST for
the majority of non-68030-optimized programs.

Depends on the card but it is likely that you would be able to add almost
anything between 2 and 256 megs ie no 14 meg limit. You should still be able
to use your ST-ram too.

Christer.

: >I'm not 100% sure that SCSI is indeed slower than IDE, but it sure looks
: >that way.

: SCSI slower???? 1.6 megs/second with a Quantum 240 LPS were verified last
: year. It's certainly some wrong piece of information you present here.

My SCSI is slower than my IDE, and judging from what I've seen of the
hardware, the Falcon has the SCSI-interface connected to an internal
ACSI-bus. (Might be possible to extract a fully working
ACSI(DMA)-connector, if you want to connect an Atari Laser to your F030)
The ACSI DMA isn't fast, and the IDE interface is a separate system,
although not DMA-driven.

Sure looks like SCSI is slower than IDE on F030.

: >Nothing. I've removed it without problems. It's no good anyway, I'd
: >recommend that you remove it in any case.

: One needs external speakers (and an amplifier) in that case, though.

That goes without saying.

: >: Then do I need to buy (immediately) NVDI, BlowUp (or somethng like that),

: I'd also recommend BlowUp or similar expansions. Best one seems to be the
: Speed Resolution Card by Hard&Soft, but this one should be built in at
: that firm (is it available in the U.S. yet?). It also sets the board
: speed to 18/20 MHz and the CPU speed to 36/40 MHz (fan necessary, but
: included). Some Falcons do not work properly with 20/40 (mostly Rev.B
: boards, AFAIK), though. This _is_ the most expensive method (400,- DMs
: plus 100,- DMs for service -> more than 300 US$s.

I'm very skeptic so such solutions, because of:
1: Who knows for how long the chips will last, if run on a speed higher
than it was designed for. A 68030 isn't that hard to come by and replace,
but the complete F030 chipset? Cost?
2: Do you really gain something? (that matters, which is memory-access.)

3: Smarter to get an external board with FastRam. More gained.

: All the other res. expansions give less refresh frequencies of course.
: But BlowUp soft is and stays the cheapest solution, and also the hardware
: expansions (SBII, BU Hard I&II, to name a few) are far behind the SRC.

: >: The Falcon memory looks incredibly expensive - does it use "funny"-ram i.e.
: >: Falcon-only stuff, or can I use "PC" ram (72 pin or whatever) with it?
: >
: >Falcon has it's own memory-cards. But there are a lot of third-party
: >simmcards around that you can buy. (100-150 USD is an estimated cost)

: Some of those have timing problems (monitor blips, etc.) if the wrong
: SIMMs are used :-(.

Wrong! There are no timing problems. The problems derivates from the
power-consumtion of the simms. Some simms need more power, and if the
card is badly designed, it will generate "ripple" on the power.
(The voltage will pend at a very high frequency between maybe 4 volts to
5 volts. And thus will the simm not work properly.) A ccouple of
capacitors placed close to the simms will remedy that problem.

: >: I realise I would be stuck with the keyboard attached to the computer *sigh*,
: >: but understand that the keyboard is much better than the ST I am using now?
: >
: >Basically, it is the same keyboard. You can get a detached keyboard from
: >a Mega or TT and use it with your F030. I've done it.

: You can also buy a tower case + MFII adaptor and use a clone keyboard
: instead.

: [PC vs. Atari]

: I'd recommend the PC if it is just the money that you care about. If you
: want MIDI/Recording or similar, I'd favour the Falcon. If it is some
: special software package that you are interested in, buy the computer it
: is available for.

: E.g. JPEG/MPEG with DSP->Falcon, Cubase Audio->Falcon, Calamus->TT or
: Atari clone (EPP in mind), not to mention all the Freeware/Shareware
: packages available, but
: Word->PC, Excel->PC, etc.

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:
: A number of people have told me that the only way to get fast TT ram
: on the Falcon is to add an 040 card.

There are 030 cards that allow you to add FastRam to your F030.
One that I know of is Mighty Sonic if I recall correctly.

: If I do this will I still only be able add memory to the card in
: 1,4 or 14mb increments or can I add say an extra 2/4/or 8mb ram to
: the card.

1, (2), 4, (8), 16 would be the correct mem-sizes, although it depends on
the design. You need 4 8-bit simms to get fastram, or 1 32 bit simm.
2 or 8 meg of fastram might be hard to get. Don't think they manufacture
simms of the required sizes anymore. (512 kb and 2 mb)
8 meg is available as 32 bit simm though.

: If say I want to add another 2/4mb of fast TT ram to the card
: how much will the card + ram cost me?

Dunno, anyone else?

In tests I've done using Dhystone the Falcon fares pretty badly. Its fine if you compare it against an 8Mhz ST in ST-Hi, but as soon as you start running in a decent colour mode the Falcon rapidly slows down. Its quite possible for a reasonable colour Falcon to be outpassed by a mono MSTE.

Which is why I bought a TT instead of a Falcon (didn't need the colour).

Roland.

I want to give you something to think about, as a loyal ATARI user like
myself. What do you think about this ATARI Dream machine:

CPU: Motorola 68030 running at 33 MHz
RAM: 5MB expandable to 36MB
Also built in speakers
CD-ROM Drive with Double speed.
Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors
Disk: Hight density
HD: 160MB
Comm: Modem and Comm prog., STALKER 3 for example

Software included: ATARI WORKS, Home Account 2, Stalker 3, also
4 CD ROms, plus games ,etc.

Price: US$1299!!!

Think about it, would you by it?
Will ATARI give you such a sweet deal?

just in case...

dhrystone is at best a test of compilers. you will see wildly different
results for any 2 compilers on the identical hardware. for example, i
seem to remember the old DRI compilers running 1/2 the dhrystones as GCC.
and merely executing a .ttp is also pointless. you must both compile and
run for dhrystone to even approach anything meaningful. finally, reporting
dhrystone without compiler info (including rev, switch options, etc) is
also virtually worthless. if a compiler has options for architecture (eg,
68030) it should be used. you cannot, for example, take a 68000 .ttp over
to a 68030 system, run it, and expect to draw any meaningful conclusions.

dhrystone is also a CPU-only benchmark. disk, display, and many other
system elements are not tested at all.

be careful in interpreting dhrystone results. in fact, i'd go so far as
to recommend abandoning it unless you really know what it does and how
it does it (ie, study the source code)...

Which CDROM drivers did you install? With a package like ExtenDOS, once
you set up the correct id in the config file, it's plain sailing.
I had big problems with some other drivers, though (ICD, Atari).

kevan@empyr.dircon.co.uk (Kevan Winch) writes:
: Hi, I've heard there is a thing called a 68001 co-processor chip.

As far as I know a 68001 does not exist, maybe you mean a 68881 which is an (external) FPU for the 68000/68010. 68881s are not very expensive, but you have to be careful. The 520/1040 series don't have a place to put the 68881 in at all. The (old) Mega ST series have one, like the Falcon, but I'm not sure about the Mega STe series. Please check out before you decide to buy a FPU! By the way: a 68882 seems to exist too. Don't know the difference, though. Anybody?

: Is it possible to put one in an ST, and if so, what difference will it
: make ?

Most of the time it makes no difference at all. DTP programs like Calamus seem to notice the co-pro and (might) work faster. A co-pro will only speed up the math routines, if and only if the program is capable of using one. But 99.9% of all ST software doesn't even care if you have a FPU.

: I have a friend who uses his ST for MIDI stuff and he finds that
: when getting it to produce music scores on complicated parts, the ST gets
: very slow. He has been thinking about getting a 28MHz accelerator
: board, but that's very expensive, so would such a co-pro help here ?

I don't know.... I guess he uses Cubase or so, and I'm not sure if that program can use an FPU.

: Cheers,
:
: Kev.

POV when optimised can run very fast too, Inshape was never a useful
program to me IMHO as I just could never get used to its interface,
and it always seemed slower than POV anyways.

I have a few questions regarding this Neon?

1. how much will it cost?
2. is it available in any other language other than german?
3. how does it compare to other 3D animation rendering packages such as the
Lexicor line?
4. what file formats does it support?
5. Is it falcon only?
6. Can it do 3D Morphing in keyframes?

>I've allready ordered my demo. By the way, who said there's no software

On any single-tasking hardware (ie. not multi-CPU) you have to wait
for I/O calls (I suppose). Otherwise you can have a conflict between read
from/write to memory unless you have specialised chip (or something like
that), witch will be controlling memory acces (sorry for my english).

Pekka , what can I say but a *big* thank you ! I've been on the net a
couple of weeks and didn't know about this site. I'm a beta tester for
CAF/Steinberg so I get all betas and updates anyway but there's other
things I don't get this way. It seems like the support guys are a bit
in the dark about internet - it's compuserve that is their "mainline",
isn't it ? Charlie Steinberg is a cool and helpful dude though.

> I love it too :-)

It's a great little program isn't it ? I've recorded/produced two albums
with CAF this year. One is finnish decent group "Ingo & Floyd" (well
Finland/Eskilstuna you might say :-)) I used CAF slaved to a 24 track
OTARI MX 80 through my SMP 2, wich worked out fine after some initial
sync ellaborations. I've also done the new "DOM DUMMASTE" album completely
on CAF (8 and sixteen tr mode) D.D. is my own very sick project with
old time friend and opera singer Lars Cleveman. (lead tenor soloist at
f.ex. Folkoperan, Stockholm)

What's going down in your AIF files, Pekka ?

This is true for Linux et al, but Minix is quite a reasonable Unix clone and
was available for the ST many years ago.

The major problem with asynchronous disk I/O (which is what you
describe) is error reporting. If the program makes a "write" call
which takes place some time later, how does it let the program know
if the write fails? The original calling program has moved on and is
now doing something else. There are various ways around this, but
most involve a degree of "assume all the writes work".

As for asynchronous reads: great idea, but only for multi-tasking
systems. On a single-threaded system, there's only one program
running anyway and it *has* to wait for disk I/O.

Mathew

Granted, but the guy's conclusions gave a rather accurate picture of what
a falcon's about. Here's a bit of my findings (I've had a 030 for 9 months
now):
- It's an extremely versatile and easy-to-handle machine
- It's got a louzy keyboard
- Processing speed slows down with increasing colours; works surprisingly
fast in truecolour mode though
- It's a good buy, considering what it does
- In general it lacks power; very few programs know to use the DSP

It does all the stuff 'the other guys' do, but it's too slow for professional
use. If it were equipped with a 040/060 set and more programs had access to
the DSP you'd have a mean machine allright, but personally I wouldn't want
to go through all that trouble.

just my 2c,

Paul

Source record: 28429
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have manged to get Gulam to run under TOSWIN on my falcon, I do however have a few problems.

1) it disables the cursor in other programmes.

2) It slow the system down

3) I cannot get the sobocon cc command to work it simple comes up with and error saying
cc: cannot frin library. 'TERM=tw52'

All I did was rename gulam.prg to gulam to gulam.tos

Any suggestions as to whats going on and how to solve it?

Rod

Falcon-SCSI uses the old DMA unit, that's right. But the limit is the NCR SCSI
controller (around 2 MB/sec). IDE can in fact be faster with the right driver
and a fast disk.

: kevan@empyr.dircon.co.uk (Kevan Winch) writes:
: : Hi, I've heard there is a thing called a 68001 co-processor chip.

: As far as I know a 68001 does not exist, maybe you mean a 68881 which is
: an (external) FPU for the 68000/68010. 68881s are not very expensive, but
: you have to be careful. The 520/1040 series don't have a place to put
: the 68881 in at all. The (old) Mega ST series have one, like the Falcon,
: but I'm not sure about the Mega STe series. Please check out before you
: decide to buy a FPU! By the way: a 68882 seems to exist too. Don't know
: the difference, though. Anybody?

The 68882 is roughly 1.5 times faster than 68881.
The Mega STE, TT and F030 has got a slot for putting in a math coprocessor.
There is a math-card you use to put it in a Mega ST.

: : Is it possible to put one in an ST, and if so, what difference will it
: : make ?

: Most of the time it makes no difference at all. DTP programs like Calamus
: seem to notice the co-pro and (might) work faster. A co-pro will only
: speed up the math routines, if and only if the program is capable of using
: one. But 99.9% of all ST software doesn't even care if you have a FPU.

Some math-intensive operations in Calamus speeds up tremendously with a
math coprocessor.
Me and a friend did a test between his Mega STE (without FPU but in 16
MHz) and mine Mega ST (8 MHz with FPU). In some operations calamus was
atleast 10 times faster on the Mega ST with FPU, than with the Mega STE.

: : I have a friend who uses his ST for MIDI stuff and he finds that
: : when getting it to produce music scores on complicated parts, the ST gets
: : very slow. He has been thinking about getting a 28MHz accelerator
: : board, but that's very expensive, so would such a co-pro help here ?

: I don't know.... I guess he uses Cubase or so, and I'm not sure if that
: program can use an FPU.

I doubt that the FPU will make any difference in music-applications.

The HBS T28 accelerator is a very good upgrade though, and
well worth the investment. It really makes the ST fly.
A friend of mine has bought it, and is very pleased with it.
Some testresults (Gembench) was very close to TT-results.

Regards, Tommy

: More information, please :-)
: I have the Falcon Wings with 16Mb SIMMs and that pixel flicker symptom.
: How can I fix that?

To make a good fix for that, I recommend that you consult someone with
good knowledge in electronics.
However, the problem as i stated is ripple on the powerlines.
The solution is to place a capacitor as close to the simm as possible
(1 for each simm) between the power and ground.
When simms demands more power than the board can supply without becoming
sensitive to disturbancies, the ripple starts.
The ripple itself is a high-frequency voltage sinuswave, and by placing
the capacitors there, you get a filter, that removes the ripple.

Regards, Tommy

Nope; WINX doesn't understand AES 4.0 and so doesn't bother patching
it.

I suspect WINX patched your ROM AES, then Mint loaded the new AES and
ignored the old one (losing you some memory in the process :-(

6867. MiNT Problems (Part 1)

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-19 19:48:55 UTC
From: bdean@hpb.hwc.ca
Message-ID: <3d4o37$20k@m.ehd.hwc.ca>
Source record: 28355

I'm using a 4 meg STe with TOS 1.06, MiNT 1.12 via the Toswin (V1.4) accessory. I also have a Minix file system (.60 PL10) mounted on one HD partition and use TCSH, I beleive it's v6.02.

Depending on the AUTO folder programs I load, (as selected by Superboot 8.0,) MiNT may or may not load it's configuration file from C:\.

For example; if I run GEMRAM(1.6)/WINX(2.2) before MiNT, my environment variables, as defined in the MINT.CNF, are not put into the environment space.

Is there a known incompatability between MiNT and TOS 1.06? ..or GEMRAM/WINX? ..or Superboot?

Anyone have an idea how did to remedy this problem?

I have a 1040st with 1meg of ram (don't laugh) and a little 30
meg HD can i use mint?

The understanding that i have is that Mint is a Multitasking
system am I correct? if not can someone explain it to me...

One other question that I had was : sometimes i come across atari files
with an extender of .tgz what is that? i have never come across it before.
I am assuming that it is some sort of archive if it is what do I need to
extract it? thanks for all your help..

1) Do you have any CD-ROM software drivers?

2) What HD interface do you have

3) What HD drivers do you have.

4) Have you made sure the drive termination, SCSI ID and parity are all
set correctly.

The most popular CD-ROM drivers around seem to be the ExtendaDOS ones. If
you have the ICD Pro utilities and MiNT then there is a version on there
which can be made to work.

Although Gulam is an excellent peice of software - its pre MiNT and very bad news IMO on a MiNT system.

As you have found out - it works but has wierd little problems. Its probably better to dump it and use KSH,TCSH or BASH. These are all ports of proper Unix shells. You need all the utilites as seperate programs as well (unlike Gulam).

:-(

Let me answer you as best I can here...

First off, you are ALWAYS better off with SCSI HD if you want to do D2D, otherwise the IDE is just as good.. and more convenient... as for the keyboard issue.. no the Falcon keybaord sucks just like the 1040 keyboard.. there is no difference (except it is dark grey).

I use an SVGA monitor with my Falcon (which requires an adapter, but EVERY monitor requires an adapter, so figure $14 on top of the price of the Falcon) I have heard the SC1224 can give you good TrueColor as will a TV, but the SVGA limits you to 40 col TrueColor (lame).. my info on the SC1224 may not be accurate as I have not tried it, but the SVGA and TV is accurate (some demos are way cool on TV)...

A 540 meg IDE drive would be great if you can get a 2 1/2" drive.. I doubt a 3 1/2 would work even if you too out the speaker because you need a special Atari mounting kit.. I guess you could try and devise your own, but even then I am not sure the cabling would work etc.. I would count on it...

All in all I had my SVGA monitor and my Falcon/4mb no HD cost almost $1100 altgether from Toad (who is a little high in price, but it has come down since I bought mine..) I had a SCSI HD too.. so add an HD and monitor to that and that is your approximate price... with internal HD add $300 with 14 mb add $300 more or so...

BTW: The memory is standard SIMMS but you need an adapter board to use them.. (lame)

Hope this helps, if any info is inaccurate feel free to correct it... I am hardly perfect...

I would strongly suggest looking at the desktop-replacement GEMINI and its
associated shell MUPFEL. Those run without problems on my Falcon.
I too was a fanatic user of Gulam, until someone showed me GEMINI+MUPFEL.
MUPFEL has about the same functionality, except that it doesn't have a
built-in MicroEmacs. Now I didn't care much about that, as I'm using
JOVE as my Emacs look-alike editor. And with GEMINI, browsing directories
and executing GEM programs is so much nicer.

P > SCSI-ASCI cable and already use a syquest. THe ST does not
P > recognise the CD at all, can someone help??

Phineas - are you by any chance trying to run it without a
CD-ROM driver program? That is a requirement for it to run - try
getting ahold of a copy of ExtenDOS from your Atari dealer and set
it up on your C partition/AUTO folder.

Other things I can think of:

Reconfigure your hard disk driver program.

Make sure the CD-ROM drive has its own SCSI ID number (the drive
manual should be able to tell you how to do this) and make sure the
drive is the last device in the SCSI chain.

Is your 50-pin ribbon cable too long? That can affect
transmission. Also, is the CD-ROM drive connected to the VERY LAST
connector on the cable (or if not, is termination set on the drive).

Believe me, once you get it all sorted out, it'll be worth the
extra effort.....

> fast in truecolour mode though

The slow processing speed of picture-manipulation in 4-,16-, and 256
-colour modes derives from the fact that Atari-programs (Graphics) try
always to represent eg. JPEG-pictures in optimised form (=dithering,
palette-adjusting etc.). That's why truecolour-mode seems fast: there's
no palette and dithering processes.

Are you sure that "processing speed" slows down with increased colour
resolution, or is it just the slower displaying that makes it feel
slower? (I agree it is still a problem).

6878. Pc keyboard to 520ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-20 14:59:46 UTC
From: foltin@cherokee.nsuok.edu
Message-ID: <D146zM.E6E@cherokee.nsuok.edu>
Source record: 28357

adapter, help.
Keywords: PC keyboard, D.E.K.A. adpter, 520ST

I acquired a D.E.K.A. keyboard adapter recently that came without documentation. It was used to connect an IBM PC keyboard to a 1040STe, I believe. The connector to the motherboard has eight pins, the 520ST has 18 pins; hence my problem and question. Would someone post or e-mail me a diagram of how to connect the wires to the 520ST.

Many thanks in advance and Merry Christmas.

Bela Foltin

Actually, at first you don't need to optimize it with assembly it being
quite radically optimized in the C source level (they halved the multipli-
cations needed in the DCT/inverse DCT phase between versions 4 and 5).

>So any thought any one...???

I've cross-compiled the IJG JPEGv5 software for my friend's STfm (M68000
compatible code) on my Amiga! We measured the speedup to be over 30%
between the new and old (v5/v4) versions of cjpeg and djpeg. Moreover,
the binaries seem to work well, so I'll release it tomorrow in a package
almost identical to the following listing [of jpegv5bin.lha for Amiga]:

If that's the basic command line converter one then it uses a _lot_ of disk space while it's converting, a temporary file 3 or 4 times the size of the original or something like that.

I'm using a Mega4 STe at the moment, and would like to use IBM software
in a reliable fashion as possible. How much did it cost? (don't answer if
I'm getting too personal). What about compatability and speed. How much
ram does it require. If more than 4 megs, how easy it ram to install?
What about colors and monitors and sound? What about hard disk space
needed? That's enough questions for now. More later if you don't mind ;')

I must admit I've had my PC a few weeks now - and I still use my TT more than it. I feel a lot happier for having the PC though. I don't feel trapped in a declining Atari market as I can get out any time I want to (and go back in any time I want to as well).

:-)

If you are interested in getting started in Atari 68000 assembly, there's
an add in ST Applications for a book/disk combo called _Introducing Atari
ST Machine Code_ for 14.95 (UK pounds). Looks pretty good, with "Complete
68000 assembler and linker...resource construction kit...debugger...GEM
text editor[/assembler shell]...source code from book...Comprehensive
listings and example of all BIOS, XBIOS, GEMDOS, AES and VDI assembly
language calls."

It's from FaST Club in the UK, and might be well worth checking out.

>load (the cookie is there) but it isn't installed (ie, boring old GEM)

I can get NVDI 3.01 to run with WINX on my TOS 2.06 MegaSTE. I just run
GEMRAM (you need a program to load GEM into RAM), then WINX, then NVDI. No
problems, and it's all there. It might run faster (if it runs at all) if I
install NVDI first, but I haven't got around to trying that yet.

Good luck,

I've heared that some time ago there was available software modem in
germany, but in few weeks time some large telecomm company bought (c)
form the authors, because high speed modems costs some about F030 - 'very
intelligent interface for the modem' with the soft-modem (about
100-200DM).

I think the problem is that you have to patch MultiTOS GEM (file:
GEM.SYS) and WINX doesn't want to do it.

regards,

Simon.

So what about the PPC? It has to be done officialy by Atari to port PPC
into atari platform otherwise there wont be intresting for programmers
and customers because of lack of any standards and applications. And the
68060 is enough backward compatibile and enough powerful to satisfy all
the atarian (I meen F030'an).

regards,

Simon.

Just *2 - I mean 68060 66Mhz
And some DSP eg.: 96k 50-66Mhz wuold be nice.
> RAM: 5MB expandable to 36MB
For present applications and TC graphics 8Mb is the minium
> Also built in speakers
> CD-ROM Drive with Double speed.
There are quadruple speed CDROMS available... (it can be optional)
> Monitor: 14 inches Color Monitor with res of 640x480 32k+ colors
I'm working on 15' NEC4fg and I use 1280*960 (16 colors) - it's strongly
adviced for DTP and even for MIDI (eg.: WYSIWYRG on CUBASE). So in my mind
17' monitor and 24bit (16bit is slowing down a system becouse of shifts
needed to set correctly the RGB values) could be enough for the moment.
> Disk: Hight density
> HD: 160MB
I'm getting run out of space on my 420MB, but if tehre will be optional
MO drive ~500Mb will be OK.
> Comm: Modem and Comm prog., STALKER 3 for example
You can have a software modem on F030's DSP (if someone will write it... :)

Hi All,

I am seriously considering getting the PAK68/3 accelerator for my
4MB STFM in the new year.

My question is would it be possible to run Linux 68K on the
resulting machine? It should be since the 68030 has the MMU onboard.

If anyone out there has tried to do this could you let me know of
your results?

Thanks in advance,

Beric..

: these chips from? Any ideas? All I know is that it's a disc controller chip
: compatible with the WD1722-02 floppy controller as used in the original ST,
: and it can also handle high density (1.44Mb) disks...

: Email replies, or here in this group would be much appreciated.

AJAX is a wd1772 floppy-controler chip.
The only difference is that it can handle up to 32 MHz clock-frequency.
(The original wd 1772 can handle up to 12 MHz without problems, very few
of the -02-02 version of the chip also handles 16 MHz without problems.

(8 MHz is used for standard DD floppys, or ED/HD in DD-mode)
(16 MHz is used for standard HD-floppys, or ED in HD-mode)
(32 MHz is used for standard ED-floppys)

There's not much else to know about it really.
(You should know that it is completely compatible, in fact it is exacly
the same chip, modified to handle higher frequencys, thus it won't change
frequency by itself, you'll have to make a small circuit that will sense
the floppy type and change frequency accordingly)

Hi!

I'm having troubles with ka9q/nos (NOS.TTP):
maybe it sounds trivial, but I don't know
how to start (make a script file)..
When I start this NOS.TTP prompt "NET>"
appears. In included docfile says that
I must type a script file (I've done that
part), and put the name of that script file
as parameter when starting NOS.TTP .
Yes, but NOS.TTP do not accept the orders
from the script file ..
(I've type the script file all 'by the book'-
just like stands in the doc)..
Can anyone help me, please ?

Many thanks,
Neven

Nope.

On a FALCON IDE _is_ faster than SCSI using the same type of drives. Falcon
SCSI can handle up to 1.8 megs/second whereas Falcon-IDE can handle up to 2.2
megs/second. The SCSI-DMA-chip is the problem in this case.

> The understanding that i have is that Mint is a Multitasking
>system am I correct? if not can someone explain it to me...

Mint is indeed a multitasking system for Atari ST (and TT and Falcon)
computers. You will probably find it quite useless (ok, I just started
a flamewar, didn't I) in 1Mb machine...

The only way to know how much memory will be required is to state what
applications you'd like to run simultaneously...

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....

- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 22/12/94
~~~~ ~~~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

2nd Update
~~~ ~~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the first news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

News and Changes
~~~~ ~~~ ~~~~~~~

Well since the original description a lot has happened. I'm now involved in
several projects, and submit work to several Internet and diskmag sources for
inclusion. I have also officially took over the maintenance of the Atari FTP
list from Hallvard Tangeraas of which there have been a couple of updates.

New items in this document since the last copy will be marked with **. All new
items are also listed below according to the date they were added.
```

The new items this month are:

22/12/94 -- Lynx Tips and Tricks
22/12/94 -- Ultra Vortex FAQ update for Jaguar
20/12/94 -- Lemmings Review for Lynx
20/12/94 -- Lynx Casino Review for Lynx
19/12/94 -- AEO Newsletter Volume 3. Issue.14 in text and ZIP format
12/12/94 -- Atari FTP List Update
12/12/94 -- Falcon Specifications and Information
12/12/94 -- Edith Professional Review by Frank Charlton
8/12/94 -- Falcon Owners Group Magazine No.7.
8/12/94 -- Newsletter format changed
8/12/94 -- AEO Newsletter Volume 3. Issue.13 in text and ZIP format
8/12/94 -- Questions and Answers pages updated, question 14.
6/12/94 -- Questions and Answers pages updated, questions 12 and 13.
6/12/94 -- CAIN Newsletter Volume 1. No.8
5/12/94 -- Got Doom on the Jaguar, expect a review soon.
2/12/94 -- Hand Made Software News (Jaguar)
2/12/94 -- Lynx FAQ updated
2/12/94 -- Jaquar FAQ updated
2/12/94 -- HENSA Atari TOS Newsletter Volume 7. No.11
28/11/94 -- Sensible Soccer News for Jaguar
25/11/94 -- MiNTNet FAQ
25/11/94 -- HENSA Atari TOS Newsletter Volume 7. No.10
24/11/94 -- Sinister Developments News (Jaguar)
24/11/94 -- Coming Soon! (Jaguar)
24/11/94 -- Rebellion Development News (Now in HTML)
24/11/94 -- Klax Review for Lynx
24/11/94 -- Kung Food Review for Lynx
23/11/94 -- A.9 added to Questions and Answers page.
23/11/94 -- Rebellion Development News

==========

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~

These are a collection of pages covering all formats of the Atari. In these pages may be found the latest news, reviews, software for downloading, and various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as intuitive as possible but there is still a lot of work to be done yet.

==========

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to

grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

Next month I will give full details on how to access the Web using the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.dl.ac.uk/MISC/ATARI/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.

==========

What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.

This section has one or two more candidates for the near future when more work has been done on the owners pages.

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Hallvard Tangeraas (essential for the latest news on who provides Atari FTP sites). This is updated in theses pages almost as soon as Hallvard changes it.
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:
~~~~~

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.
**MiNTNet FAQ by Christer Gustavsson. Everything you wanted to know about **MiNTNet.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them. These have been re-organised to make it easier to keep track of. At the moment there is:

- CAIN Newsletter containing the latest Atari news.
- HENSA Newsletter containing the latest updates to the HENSA Atari archive.
**AEO Newsletter containing the latest Atari news.

****

Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive. All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)
**Edith Professional review by Frank Charlton (ST Format)

There are several reviews on the way by the above mentioned people aswell as some by myself (waiting to get hold of Apex Media for the Falcon). This section should hopefully include around ten or more reviews by Christmas.
~~~~~~~

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is out of date, but I hope soon to have this updated on either a monthly or even weekly basis.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Newsletters from HENSA on Falcon section of archive.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.
**Falcon Specifications and Information compiled by Rod McCall.

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. At the moment the following software is included, with more to come:

- Play MPEG v0.68 by M.D.Griffths (shareware)
- Speed of Light v3.5 (shareware picture viewer)
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.
**FOG issue 7 diskmagazine for Falcon.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).
- FOG issue 6 diskmagazine for Falcon.

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are small descriptions or full features with pictures. At the moment there is:

- Newsletters from HENSA on TOS section of archive.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major revisions to be done with updates. At the moment the following software is included, with lots more to come:
~~~

- Speed of Light v3.5 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Ozone. Good platform/puzzler.
- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust

New reviews are:

Klax Kungfood Lemmings
Lynx Casino

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:
~~~~~

- Lynx FAQ
**Lynx Tips and Tricks

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~

Currently holds news of Bouble Trouble and Super Off-Road for the Lynx. Expect reviews soon.

****

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar.

**Rebellion Development News
**Sinister Developments News
**Sensible Soccer News
**Coming Soon!
**Hand Made Software News

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. Reviews so far include:

Aliens versus Predator Raiden Tempest 2000
Cybermorph

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

- Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
**Ultra Vortex FAQ update for Jaguar

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Nils Jacobsen

There are others that will be included, some containing more recent news, but the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and are very comprehensive. Nearly everything you could hope to find is contained within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~

Some structural changes are likely to appear in the next months. I will be introducing an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

Also coming soon will be a monthly editorial. In this I will try and sum up the month past and to give my opinions on how I saw things for Atari at that time. Hopefully I will be able to look back over many good developments in my pages and summarise them as they happened.

There is an outside possibility of starting a programmers and MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson.

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I now own a Jaguar and will soon be writing a review for Aliens vs Predator. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Extra pictures will appear due to my recent access to a colour scanner, enabling me to scan the latest pictures before the exist elsewhere on the Internet. I also hope to slowly get all the maps for AvP into these pages somehow?

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.
~~~~

The Lynx section is to continue to get reviews and I will update the news as and when I get it.

Expect more links to Atari related pages in the future, aswell as links to all the Atari related newsgroups. There will be more newsletters, documents, updates to the FAQ's.

Expect further reviews from Andy and Frank, along with myself (watch out for the Apex Media review). Hopefully I can include more screenshots, and do a few program tutorials. Also Claus J. Pedersen (Stello author), Bob Brodie (former Atari employee) and Steven Davies have all offered to support these pages with contributions in the future.

Last but not least, after Christmas I may set up a feedback page, where you can send your feedback via a Web form. Until then please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

6902. Problem with STeno 2.10 in MedRes

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-22 13:56:23 UTC
From: cordes@ac.dal.ca
Message-ID: <1994Dec22.095623.31636@ac.dal.ca>
Source record: 28382

I'm very glad to have the new update to STeno 2.10. However, has anyone else found that the drop-down menu under Edit doesn't work in ST medium (on a MegaST 4, SC1224 monitor)? An alert comes up to the effect that the menu is too long.

John

6910. SCSI for my 1040ST - how???

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-22 20:30:42 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <ELXHCGWSUp@stingray.manawatu.gen.nz>
Source record: 28390
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

What would the easiest way to use a SCSI drive on my 1040STfm be?

I know there are ICD et al. adaptors out there - but I don't know which is the best for what I want - I don't need a lot - I just want to be able to run a 540Meg SCSI drive from it.

I don't want to pay a lot for it, as looking at an early 94 ST Mag from the UK, most of the adaptors are almost the same cost as the drive.

Could you please tell me the prices for them? I have a UK model ST if that's any help.

Also, what would I need to buy with the drive to get it all setup? I presume a case and a fan - that's no problem though - but do I need a power supply, or can it get power from the ST or the SCSI adaptor? And do I need to buy a cable aswell, as these companies always seem to charge extra.

I'd really appreciate any help you guys could give me, also perhaps the address of the best place to buy one. I don't mind buying from the USA, if the mains voltage is not of concern, as we use 230V 50Hz (like _most_ of the world). But Europe would probably be the easiest (providing they either speak French or English).

Thanks,
Richard =8-]

PS. Have a great Christmas all =8-]

It works fine on my Falcon 030 in ST medium, at least as a program. Did you
perhaps forget to copy the updated resource over along with the prg/acc?
I just checked and the edit menu is only 18 lines long, plenty short
enough for ST medium.

6912. Problems with PowerUp 2..

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-23 01:26:42 UTC
From: sgg@veda.is
Message-ID: <D18pCI.GG1@veda.is>
Source record: 28292

Hi!

I'm in desperate need of help. I've just bought an accelerator from System Solutions called PowerUp 2 for my Falcon. I bought it as a kit and installed it myself. Well, it worked for about 2 minutes and then chrashed everything. Naturally I didn't like this and resoldered everything but now when I boot my Falcon it's like the reset button is stuck in (everything is black), so I have to push it a few times to boot. I thought that this accelerator would work on all Falcons... I really hope that you can help!!

TIA,
Sigurdur G. Gunnarsson (sgg@Veda.is)

6913. atari laser printer convertion?

Newsgroup: comp.sys.atari.st.tech

Does any one know if there is a convertion kit to enable the use of Atari SLM 605 with an IBM compatable computer? email appreciated.

6914. [F030] Removing Bass Boost - how?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-23 12:26:35 UTC
From: sanders@sci.kun.nl
Message-ID: <D19JwC.n06@sci.kun.nl>
Source record: 28294

Hello,

I would like to remove the bass boosting circuit from my Falcon.
I connected it to my stereo, and it's *very* noticeable. Could some
kind soul (who's already done it) tell me exactly what to do?

BTW, I'm not afraid of soldering. I installed BlowUP internal
myself, and I even managed to fit a resistor and a capacitor inside
the RCA plugs :-)

It's really great, BTW, to have it connected to the stereo.
At last I can impress my friends with my Falcon! First, I show them
the rotating zooming fractal cube from the X-Perience demo (Great! At
last one that works on VGA!), then I switch on my radio and have
Mariah Carey sing the bass, or sound like Mickey Mouse, or like one of
those Ceylons from Galactica. Great!

Having a good time again,
--
```
/* sanders@sci.kun.nl */ main(){char*c="2$$,$$2CD$45$$,$$5(D$4%$$,$$%(D$4%J*/K*%(K,K2MMPL%
2HLH,4LLLL$4HLF$4RLLS$4HL%;5MLLD$5HL&<5MLPL$5HLHL2R,/K$2(K,+";
int i=0,j,k;for(;i<10;i++){for(j=0;j<11;j++)for(k=0;k<6;)putchar(c[11*i+j]-36&1<<k++&&j*6+
k<65?'#':' ');putchar(10);}} /* ATARI Falcon030 */
```

6915. Re: Software for sending file

>over, and put it back into your PC. Atari's can read PC disks.. just
>not the other way 'round.

Any ST with TOS 1.4 or later can format disks fully compatible
with all PCs. Also most 3rd party disk formatting utilities for the
ST will do this. It was a bug in TOS 1.0 and 1.2 that formatted
disks that PCs rejected.

I regularly exchange data BOTH ways using either ST or PC formatted
disks.

One thing to be aware of though is if you are using PC formatted
disks in the ST is that the ST will get confused on disk changes,
because media change on the ST depends on the "disk serial number"
changing and the PC disk formatters don't generate ST "disk serial numbers".
This means that if you remove one PC formatted disk and insert
another, the ST probably will not realize that the disk was
changed (both have the same serial number) and not read the FAT
and directory of the 2nd disk. This will result in some strange
behavour and will corrupt the 2nd disk if the ST attempts to write
to it!!! When using PC formatted disks on the ST always place an
ST formatted disk in the drive an "access" it before placing another
PC formatted disk in the drive!

No, that's not the problem. The same (patched to 2.10) version works
fine on my MSTE with mono monitor.

6918. Chips in the ST

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-23 18:46:01 UTC
From: jtempril@uoguelph.ca
Message-ID: <3df5t9$ooc@nermal.cs.uoguelph.ca>
Source record: 28297

Hello!!!

I recently popped the lid of my ST and took a look at some of the chips,
if anyone has any knowledge of what these chips might do, then please POST!!

LIST Location
==== ========

(two) MC6805P right by the 68000CPU (bless its soul...)

SC87898P close to these other chips

C02 5914-38A (PROM) underneath the centre metal plate dead centre on
the board

I also found 2 unused slots for IC's but I dont know what one can use
them for, they are labeled

C0 25912-38 C028915-38
JH23-019 AND JH 23-020
5l1 65 5L3 50

Also, If I wanted to get a new version of TOS... how would I but it in???

Cheers!!!

To remove the bass boost on the output:

Change C58 and C59 from 100PF to 1000PF.
Change R123 and R130 from 10K to 15K.
Change R59 and R68 from 100K to 4.7K.
Change C95 and C90 from 0.033yF to 1K Resistor.

>the atarian (I meen F030'an).

I've said it before and I'll say it again... Making a PowerPC-based TOS
computer would be a stupid way to commit suicide for the company
building it.

Why, you ask? Observe:

1) *All* software would run in emulation, probably about as fast as a TT

2) ST-compatible video (ie, like the ST, STe, TT, Falcon) would slow
the processor to a crawl; if you use incompatible video, you lose all
those annoying programs that try to hit the video directly

3) Linux would be the only native PowerPC software available; there are
almost *no* Atari developers left to recompile their commercial apps

#1 is the kicker though... why spend at least $2k US on a system to run
slightly faster than a TT?

> for example, take a 68000 .ttp over to a 68030 system, run it, and
> expect to draw any meaningful conclusions.

What I did was to take a copy of dhrystone.c and compile it up under GCC.
I then used the *exact* same binary to test 25 or so Atari configurations
(thanks to all the people who actually did the tests for me). I used the
same binary both on 68000 and 68030s as I figured that most Atari software
didn't make use of the 68030 instruction set *even* if it had TT or Falcon
only features.

I distributed the source, the makefile and the executable to all testers
so they had a base to work from and understood exactly what the test was.

The results I ended up with are a *relative* comparison of the CPU performance
of Atari machines. I happened to use the dhrystone benchmark to achieve
this - but I could have used any arbitary test. I'm *not* making any claims
for dhrystone tests across platforms - though I have included a few non
Atari results for interest value.

> dhrystone is also a CPU-only benchmark. disk, display, and many other
> system elements are not tested at all.

Agreed - but actually I'm *only* interested in CPU performance. Caches and
memory type does affect the figures as does screen mode. Though of course
in the latter case I make no claims about drawing speed, just how certian

resolutions affect the result.

> be careful in interpreting dhrystone results. in fact, i'd go so far
> as to recommend abandoning it unless you really know what it does
> and how it does it (ie, study the source code)...

Well I will admit I haven't studied the source in any detail - but I believe my testing criteria is strict enough for this not to matter. In general though, I've had enough experience with dhrystone in the past to realise that cross platform tests can be *really* out.

:-)

Roland.

@CiX

BTW I'll be posting an updated list soon, probably to ~.tech only.

there is nothing wrong with your procedure, provided you mention it in
your results. my point was to emphasize the fact that compilers can play
a large role in dhrystone. if a *system* consists of a computer and its
software (including compilers) then your test may not, however, fully
test each system.

the problem i see is that people interpreting results have a tendency to
latch onto a single number. it would, therefore, be inadequate to state
that the dhrystone rating of system A is X and system B is Y, etc, based
on your method (though i would suspect that GCC would be about as close
as you could get to maximum performance via a compiler). i do not know
what impact compiling for 68030 via GCC would have on systems with 68030s,
however, so i cannot state how far off your test might be (if someone
were to use it as a sole metric).

note that i have even seen disclaimers on dhrystone posted (recently) by
its author.

>The results I ended up with are a *relative* comparison of the CPU performance
>of Atari machines.

well, ok...

you should also know that dhrystone v1 vs dhrystone v2 can give about a 2x
difference in results, on the same system, with the same compiler, if you
can inline some functions in v1. i have not looked at dhrystone in a long
while, but i seem to recall that inlining the strcpy (?) will save quite
a bit of overhead in the call since it is in a fairly tight loop. this
was "corrected" in v2.

also note that dhrystone ratings are still quoted by many vendors (mostly
in the workstation market).

I have a MigthyMic board too, but when trying those 'topless' SIMMS it
wouldn't run. Replaced them with ordinary 3 chip SIMMs and presto, works
like a dream.... (though the topless SIMMs work ok in a 486 PC...)

Ofir, thanks for the information. Do you know which AES 4.10 calls it
will _not_ be supporting?

Also, how can you state "and it works" when it hasn't been released yet?

> not, however, fully test each system.

Well I must admit that in my first published results I was a little hazy
- even myself as to what I was aiming at. I only got into dhrystone testing
as I was trying to determine just how good the PAK3 was. My next set of
results will be clearer on this.

> the problem i see is that people interpreting results have a tendency
> to latch onto a single number. it would, therefore, be inadequate
> to state that the dhrystone rating of system A is X and system B is
> Y, etc, based on your method (though i would suspect that GCC would
> be about as close as you could get to maximum performance via a

This is always the problem - as it would be *nice* if dhrystone tests were
comparible across platforms. I've always known this problem though, even
if I've sometimes tended to 'forget' it However if I do compare tests
across platforms then I can only conclude Ataris are very slow. Eg I
recompiled my stock dhrystone on a 486SX2-50 under linux using GCC (2.5.8
instead of 2.3.3) but all the same flags. On a TT this produces a result
of about 5000. On the PC I got a result of 50000. Now the PC is faster
than the TT, but not truely 10 times as fast! Either the compiler is making
a big difference or the 8K primary or 256K secondary cache is responsible.
Anyhow I wouldn't want people to think the TT is 10 times slower than a
pretty averagely speced PC ;-)

> compiler). i do not know what impact compiling for 68030 via GCC would
> have on systems with 68030s, however, so i cannot state how far off
> your test might be (if someone were to use it as a sole metric).

I intend to recompile for a 68030 and do some tests with that. They will
be clearly marked though.

> you should also know that dhrystone v1 vs dhrystone v2 can give about
> a 2x difference in results, on the same system, with the same

I knew about this - but considered it not a problem as I was using the same
binary in all cases.

> also note that dhrystone ratings are still quoted by many vendors
> (mostly in the workstation market).

Yes I've noticed this. Makes it all the more tempting to do cross platform tests.

:-)

Not entirely sure what you mean by 'topless' SIMMS? I was using a mixture
of 3 chip and 9 chip in mine.

Sure these aren't MC6850s? You should have 2 6850s which are ACIAs (or UARTs if you prefer). One does the 68000 end of the keyboard interface and the other does the midi ports. Its a pity Atari didn't use a 3rd for the serial ports :-(

> C02 5914-38A (PROM) underneath the centre metal plate dead centre

Well the metal 'box' in the middle of most STs covers the shifter chip. If its a 40pin DIL chip (often socketed) then this is probably it. Forms a large chunk of the video circuitry.

> I also found 2 unused slots for IC's but I dont know what one can use
> them for, they are labeled

They might be for extra ROM chips (see below) though I would expect none or 4. How many pins do the slots have.

> Also, If I wanted to get a new version of TOS... how would I but it
> in???

Normally by pulling out the original ROMs and putting new ones in. You should have either 2 or 6 ROM chips. If you have 2, then you might have 4 empty sockets or solder pads for sockets. What version of TOS do you have - and what do you want? Going above TOS 1.4 on an ordinary ST or 1.62 on an STE normally requires an adaptor board.

:-)

Topless SIMMs are a brand, they were named after the fact that the SIMM's
don't contain soldered-on chips but have the 'naked', read topless ;-)
crystal directly glued onto the SIMM board. It's only covered by a black
'blob' of some kind. They were very popular (are still?) after that major
fire-in-the-factory story which pushed the prices of memory chips way up.
And although these SIMMs are quite fast (60 ns) they just don't work in my
TTs fastRAM board. Those topless SIMMs are still available and most of the
times fairly cheap.

6939. X Windows up and running... sort of

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-26 20:22:20 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <788473340snz@bigbox.demon.co.uk>
Source record: 28320

I am having problems with running X Windows (MiNT version).
I have a Mega STE 4 (mono monitor). I am using MiNT 1.12, MiNTOS 1.4b, MiNTnet 0.55.

The problem(s):
If I have a $HOME/.xinitrc then X won't run - it complains that it can't find /home/polo/system/.xinitrc in the PATH.
If I don't have this file, then I get an xterm, but no twm. Any attempts to run another xterm or twm cause bus errors and so on.
Finally, if I boot using MiNTOS and run it after logging in it gets nowhere - any program that it tries to tun bombs (xterm, twm etc etc).

Any help appreciated, because it looks great otherwise.

Also: I have been told that the 68010 is capable of VM, and is pin compatable with the 68000. I have TOS 2.05. Would I be able to drop a 68010 in my Mega STE and get any benefits (mainly VM).

Thanks,

Ben

PS What UNIXMODE settings are there? I especially want to know what /-ru set up.

Well, an Archive Viper 5150 runs just fine on my TT on the SCSI port (with Gemar as backup software) and it should also run through an appropriate DMA-to-SCSI adapter (ICD link or so) on a ST. With this streamer you can use 150 Mb or 250 Mb tapes (without compression). I also heard of several DAT streamers being used nowadays.

Running in just 4Mb? Thats insteresting. I've tried installing X on my 4Mb
PC and the notes warn that it will thrash the disk crazy doing VM.

I hate to say it - but its probably memory related - or somebody has
compiled something with the 68020/68030 flag on.

> Any help appreciated, because it looks great otherwise.

Could somebody remind me where to get it from?

> Also: I have been told that the 68010 is capable of VM, and is pin
> compatable with the 68000. I have TOS 2.05. Would I be able to drop
> a 68010 in my Mega STE and get any benefits (mainly VM).

The short answer is no.

The long answer is:

The 68010 is capable of working *with* a MMU unit to do VM. The first
680X0 chip to have the MMU built in is the 68030. Even with one of these
fitted you will still need a VM driver package. 'Outside' is probably the
best bet. The most suitable 68030 upgrade is probably the PAK3.

In all honesty though I would advise selling your MSTE and buying a TT.
A TT is much more suitable for X than an upgraded MSTE. How do I know this?
Well I was in *exactly* the same situation as you and spent weeks sorting
out how much a decent upgrade to do VM was going to cost. In the end I
bought a second hand TT which has 8Mb RAM and a 18" 1290x960 paper white
monitor. Excellent for X (though I must admit I've been sidetracked by
Linux on the PC). A second hand TT setup should cost you you no more than
upgrading your MSTE if you take into account the money you will get from
selling the MSTE.

What I'm intending to do is run the TT as an X station server with the PC running Linux as the X client. That way I should end up with a rather neat and pretty unique (well fairly unique) X workstation.

> PS What UNIXMODE settings are there? I especially want to know what

If you use MINIXFS then UNIXMODE is unecessary. MINIXFS is *much* better for MiNT work than UNIXMODE.

:-)

Roland.

@CiX

BTW if you by a TT then you also get to run Linux which will do X shortly and shoud do VM as well.

> STE and get any benefits (mainly VM).

I`m quite sure you could plug a 68010 in, but to my knowledge it would
do VERY little difference. I seem to remember that some instructions
use less time executing and that there`s some kind of loop-mode. It also
has a couple of extra functions/registers that can be used to implement
some kind of VM. However, to be able to use this you`d have to write
your own code because AFAIK no program today supports the 68010. The
improved instruction execution times might give you a percent or two
extra "horsepower", but I don`t think it`s worth doing.

Also, one MAJOR problem you will run into is to get a 16MHz 68010. Once
upon a time I owned a STE with a 16MHz accelerator. The 68000 was
mounted in a DIL-socket and I looked REALLY hard for a 68010DIL @ 16MHz.
After much looking I had to give up since Motorola had discontinued
them and nobody had any in stock. I don`t know how difficult it would
be to get a 68010 PLCC (which I think is what you need for your MSTE),
but my guess it`s equally difficult (read *impossible*).

Note: Plugging a 68010 into a TOS < 2.xx computer will not work since
one instruction dealing with SR-manipulating has been altered and
only runs in supervisor mode. The machine won`t be able to go through
the bootup.

Take care!

Yes, that`s true. I`m successfully using a Wangtek 6130HS DAT-streamer with my Falcon. To drive it I`m using Erland Henanger`s SCSI-drivers to give me a /dev/tape unde MiNT and the normal GNU tar to store and retrive data. Gives me ~1.3GB/tape uncompressed.

Works great! :-)

Well The New Port of JPEG5 on A.A. is very very buged,
the file that I used with JPEG 4, comes out OK a 250k GIF
File, but the file from JPEG5 doses not work and comes
out as a 10meg file..??

We should have soon a Real Atari port of JPEG5A, these other ports are not ment
for Atari, no TTP help files and no memory check, the JPEG4 does support all
that, but will not find files when run from a folder...

Come on chaps less of this crap, if you are not a Atari user, Please don't port
stuff that you can't test, and is not configured for the Atari platform..!!

So both JPEG5 ports are Buged, the one on A.A and the other on tu-berlin...

Or is it the source code that is buged...??

A bit like running GCC in 2.5Mb from floppies. Possible but only just. 600K isn't bad though - I just don't understand how its possible? A few weeks ago when X11 for MiNT was first mentioned, 12-20Mb was talked about. How come its now dropped to under 2Mb? Is this just the server or something?

> Its now available on a.a. in Mint/X11/

Thanks.

> If I could afford it I would :-) Anyone selling a (ridiculously) cheap
> TT in the UK?

Well not cheap - but they can be had for the 500-750ukps (though I will admit I paid more for mine). OTOH I got 460ukp for my MSTE so what I paid out on the TT was less than a PAK3 accelerator was going to cost.

> This is what I had assumed, but a lot of programs (Emacs, X11, less
> etc) need UNIXMODE correctly set or they don't work.

So they make specific checks for UNIXMODE? In that case I don't know. I'll see if I can find the documention.

:-)

Hello all!

I've recently been able to get MintNet up and running thanks to the availability of Mint v1.12 in binary format. I have a slip connection going just fine with telnet, ftp, and gopher all talking to the real world.

The problem is, I have been trying to get ntalk, ntalkd, inetd, and X up and running without much success. My system is a 1040STe w/Adspeed STe 16mhz accelerator, 14.4k modem, mono/color, with a 32 meg minix partition (k:) just for mintnet.

That said, here's the problem:

with inetd, I get:
/pipe/log: file not found

with ntalkd, I get:
/pipe/log: file not found
/pipe/log: file not found
<27> Dec 27 23:07:52 talkd[67]: chdir: /dev: file not found

Are these problems related? Are they easily repairable? I'm not sure I know what I am doing yet, but I seem to be on the right track.

As for X windows, I think my problem is based on zoo not extracting the filenames correctly. Is there a zoo program which will give me the correct filenames with complete extensions?

Frustrated/Excited,
Steve

Try atari.archive.umich.edu or one of its mirrors. If it doesn't
let you in (its got a ftp user limit), it should give you a list of mirror
sites.

Hope this helps.

> Soemthing to show my friends who are all PC-suckers... ;)

I talked a bit more to him and it seems he has X and twm running, but no more memory for xterm! But we're both trying to work out how to run clients remote - so we can use another ST's (or Sun's) RAM. I've tried setting the DISPLAY variable to bigbox:0 on the remote machine, and it makes contact with my X server fine. Unfortunately my X server promptly refuses on security gounds! Arghhhhhhhhhh! I am trying to find docs on how to setup an authorisation file so I can type "X -auth file" and give remote machines rights to my terminal.

I now have X almost fully working. What I do is:

```
kbd -n ; pty
setenv UNIXMODE /ru
setenv DISPLAY :0
X &
xterm & twm &
```

My problem is that xterm only seems to run under certain circumstances - like it is the first program that is executed under X. Any X client that is run after it crashes violently, as do a few other programs that aren't X specific, and sometimes it takes out twm and the whole system goes down. Have I got a corrupt version of it or have other people experienced similar problems?

Never had such a problem here. I don't use Blowup so i might be the reason.
One thing i could think of is the HDDRIVER. I don't use that either, (i use
Hushi). I've used Ahdi as well, and none of those gave me any problems.

Maybe you should contact Daron, as i just saw a message from him in NeST
where he said something about timeout problems on his harddrive. Maybe
you could find something there. I know he'd try HDDRIVER as well.

I get these too. I assume its the prog trying top talk to syslogd - which
I *don't* have running.

> <27> Dec 27 23:07:52 talkd[67]: chdir: /dev: file not found

This looks more troublesome - though its 2.45am here and I'm not about to
speculate what the problem is! ;-)

> I know what I am doing yet, but I seem to be on the right track.

You seem to be on the right track :-)

One thing I did notice today was that I moved my /etc from a TOS to a
MINIXFS. Now on the TOS partition inetd was happy with inetd.con. However
as soon as it got access to a MINIXFS it required inetd.con to be renamed
to inetd.conf. This problem only came to light after I tried inetd -d as
nothing seemed to be working.

Also has anybody got the ping in pin-00.tgz to work? All I get is:

ping: unknown protocol icmp

Thanks

Roland.

I was going through this about a year ago. First off, any SCSI tape drive will work as long as you have a SCSI host adapter (I use an ICD). Make sure you set the ID to an unused ID number.

Next, I know of two commercial packages that work well. Probably the most popular would be Diamond Back 3, which has tape drive support. If it's anything like Diamond Back 2, it'll take you all of three minutes to install and learn how to use.

Since Diamond Back 3 wasn't out when I bought my drive, I bought a package from Beckemeyer development. It's a little on the old side, but does not have any comapatability problems that I've heard of. It's simple to use, although I believe the error handling could have been done better (e.g. it crashes if you try to write to a write protected tape). You also get a tar program, which will allow you to write to a tape with a Unix tape drive, and read it with your ST. This is really handy if you grab a lot of software from an FTP site. Or any of the GNU stuff.

If you have any questions, email me.

>Harddrive activity LED is ON and after clicking cancel many time I get back to
>the desk and have to reset the Falcon to get access to the Harddrive again.

I have had the exact same problem, although a more common occurance would be
a lockup during a file copy or move. This only happens with my external
SCSI drives.......a reset, like you said, is then necessary.

One thing I can't understand, however, is why if I run a totally clean system
(no BlowUp software running, but the hardware still in place) do my external
HDs exhibit the same problems?

I too would like an explanation or fix for this problem. I was going crazy
trying to find out what the problem was with my setup....

Yes, they do, esp. in High Colour modes on an RGB monitor. But these
problems do also occur in 256 colours.

>I too would like an explanation or fix for this problem. I was going crazy

You get 600K under 4 megs when running the server plus one xterm. On a 2.5Meg
STFM you can just fit the server and twm... very useful ;-) But it is enough
if you can run programs on another machine's memory.

> So they make specific checks for UNIXMODE? In that case I don't know. I'll

This is more or less what I'm trying to do.

My PC running Linux isn't really up to running an X server as it has only
4Mb RAM and a 14" VDU.

My TT OTOH has 8Mb RAM and a 18" VDU.

Now the TT should be able to run the X server *and* all the client programs
at the same time - but I thought it would be fun to link the 2 machines
together to make one *really good* X workstation.

So far I've got MiNT-Net talking to Linux/PC. NFS works one way only
though. I need to read up a *lot* more on X before I can continue on the
X side.

BTW can the current implementation of X for MiNT cope with a TT-Hi screen?
I heard it was mono only, but didn't know if that meant 640x400 only?

I'm waiting untill the last moment before I download it as I only want to
have to do it once ;-)

:-)

Roland.

No, this has nothing to do with the driver. There are a lot of Falcons
where SCSI transfers don't work because of hardware flaws. There are about
6 hardware fixes available for that purpose. Which one you need depends on
the revison of your Falcon motherboard. Ask your local Atari dealer (if any)
about it. At least here in Germany several dealers know how to fix these
problems.
BTW, these problems are known for more than a year now. They can happen on
any Falcon and they are worst when working with high resolutions. This has
something to do with the bus timing.

: Steve: do journalists count as professionals??

Not the ones that write for the Mirror, Sun, Sport and People.

I was implying that many organisations, such as Universities, probably would not
find this kind of word processing platform as stable or powerful as,
say, Word on Mac/PC.

With a more common platform such as Word or WPerfect, data is just som
much more compatible between institutions.

For example, my Uni uses Word/PC - As a scientist, I publish data in
Journals. A requisite of many Journals is a written copy AND and copy on
floppy, of the article. I just don't think they'd accept Papyrus docs.
(in fact I know they don't!).

BUT - If the Papyrus system works for you then use it.

Steven

True and not true. There are file formats available, such as the RTF
format, that allow for what you are looking for and are supportyed by
Word, Word Perfect and Atari wordprocessors.

: For example, my Uni uses Word/PC - As a scientist, I publish data in
: Journals. A requisite of many Journals is a written copy AND and copy on
: floppy, of the article. I just don't think they'd accept Papyrus docs.
: (in fact I know they don't!).

Well, they accept RTF docs. IMO, most scientific newspapers would like to
see TEX docs - so you can forget Word, Wordperfect and the lieks as well.
IMO, it would even put a bad light to use MS word for professional
scientific publivations. At least the output, for example of the Formula
editor, would cause people to vomit all over the world (but with "Formula"
on the Atari that is, of course, different)

: BUT - If the Papyrus system works for you then use it.
More than happilz (well, in my case not papyrus, but Tempus Word..)

Regards,

Alfred

>(in fact I know they don't!).

Papyrus can export RTF files which should be accepted. The only thing missing AFAIK is pictures since there is no common picture file format for the platforms using RTF. TIFF would be a fine soulution, though...

>BUT - If the Papyrus system works for you then use it.

Pap is simply *the* best WP for this platform. With the excellent support and developement from R.O.M. I can easily reccommend it to anyone. Also, if you're in Britain, HiSoft offers student discount on the package, making it an even better buy.

It is. You can get syslog as part of the MiNTOS package. I have been meaning
to try linking /pipe/log to /dev/null to see whether it removes the errors
and saves memory (for when I try X :-)

In your mint.cnf do you cd u:\? I think it is just looking at the wrong drive
for some reason.

Its a good idea to put all MiNT stuff on minixfs. And its faster too. The
only things stopping me from going 100% minixfs (with exception of c:) is that
when I get a problem on a minixfs partition (Rwabs error nnn) I have to
minit the drive as there seems to be no sector level fixers - just the inode
level fsck.

> Also has anybody got the ping in pin-00.tgz to work? All I get is:
> ping: unknown protocol icmp

If thats the one on a.a. yes. IIRC I just used it straight away. Maybe your
inetd/protocols/services or one of the many other config files is wrong?

AFAIK the mintlib only uses:

r : default root drive (e.g. rU)
b : open files in compatible mode
s : the ecec() functions detect scripts which start with `#!'
and feed them through the appropriate interpreter (this
should really be done by the kernel)

You should however be aware that some software (sendmail for example)
will not pass its original environment when calling exec[lv]e(). Therefor
I strongly suggest that you change the default behaviour of the mintlib,
and recompile your source-tree completely (except for kernel and drivers).

In miscellaneous articles, miscellaneous people write:

> I am looking for a TCP/IP package for my ST does anyone know
> where i can find one? I have looked alot and seem to come up empty.

There are two available: MiNTnet and KA9Q-NOS.

KA9Q-NOS:
Standalone package. A little tricky to setup. Text based. A little bit slow.

MiNTnet:
TCP/IP extension for MiNT, based on the unix system. Consists of a driver and
seperate programs. Much more tricky to setup. Much faster and versatile, but
also much bigger than KA9Q-NOS.

Someone should put this in the FAQ.

No, there's more....

Depends what you want to do with the code really, I use PE1CHL NET here
which is handling 10 ports (6 x 1200Bd, 2 x 9600Bd, 1 x 31250Bd and 1 x
38400), along wih others on development systems.

I have a range of packages from early 87 onwards.

PE1CHL NET:
Very good indeed (in my opinion the best - unbeatable at high speed).
Has intrinsic drivers for SCC and ESCC chips, faster SLIP speeds (mine
does 38,400 SLIP on the standard MFP) and the PACSAT protocols. I'm
beta testing the latest version with ethernet drivers as well.

GeMNOS:
Full featured NOS based on GRI specs, currently at beta.4

KA9Q-9410xx for OS-9/68000
Rather natty version I'm working with at present, for full
multi-tasking - but needs more work (and ISP/NFS in the kernel).

Cheers, Martin.

Papyrus does export Rich Text Format files, a Microsoft standard that
their product "Word" should be able to load just fine. Maybe you too
could make use of Papyrus on projects for your University.

I still get the problem and could not find a solution, I gave up on the ICD utils and HD-Driver as they made the problem worse. I use AHDI 6.061 which seems to the the most reliable. However I still get the problem when shifting big file around.

It worked, and its fun, but you really need something faster than SLIP (19200).
I was going to grab some instructions for building an EtherNet card from a.a.
in Network/EtherNet/... but the files have disappeared! Anyone know where I
can get them?

> My PC running Linux isn't really up to running an X server as it has only
> 4Mb RAM and a 14" VDU.

Surely that's enough for just the server?

> BTW can the current implementation of X for MiNT cope with a TT-Hi screen?
> I heard it was mono only, but didn't know if that meant 640x400 only?

I think so - it can cope with overscanned STFM screens.

> I'm waiting untill the last moment before I download it as I only want to
> have to do it once ;-)

It is a fairly large archive to download every time a little bug gets fixed.
Hopefully bugfixes and so on will mean distribution of the fixed programs
separately...

6982. New TOS bug ?

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-31 14:23:05 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <12311994.142305@empyr.dircon.co.uk>
Source record: 28264

Hi,

I suspect I may have discovered a new bug in TOS version 1.4

I recently upgraded my friend's 1040ST from TOS 1.0 to TOS 1.4 and now it refuses to talk to his Akai X7000 sampling keyboard correctly.

More specifically, all three programs we tried, Universal Sound Designer, Turbosynth and SF Librarian / Sample Editor reported midi communications errors. The SF Sample Editor was more specific, reporting midi checksum errors. These errors only occur when trying to transfer sample data via midi.

Suspecting the TOS, we re-installed TOS 1.0 and all the errors disappeared, everthing worked perfectly. We have tried running Poolfix3.prg, Poolfix4.prg, cache90.prg and Tos14fix.prg, i.e. all the TOS 1.4 bugfixes we know of, and it made no difference, the ST still reported midi errors. The only patch we didn't try was the RS232 RTS/CTS one, but that wouldn't have any effect on the midi ports would it ?

We tried new midi leads, checked all the connections, etc etc, but the ONLY way we could get it to work correctly was by re-installing TOS 1.0 and this is the only variable in the equation.

Is anyone aware of any midi bugs in TOS 1.4, and if so, are there any patches available to fix it ?

Has anyone else experienced any midi problems with TOS 1.4 ?

The system setup is a 1040ST with 2.5Mb RAM and a mono monitor.

All ideas, suggestions, comments and wild guesses are very welcome indeed!

This is proving a real pain in the ***, so * ANY * suggestions would be greatly appreciated.

Hi,

I'm running version 6.5.5 of the ICD Hard Disk Driver software on my Atari ST (520 STFM with 2.5 Mb RAM) and a ADSCSI+ host adaptor board with my Rodime RO3000T 105Mb SCSI Hard Drive.

I accidentally ran the ICD 'Bootfix' program, and now it takes much longer to boot up. Is there a way I can undo the changes that Bootfix made, perhaps using a sector editor or something ?

Also, is there any way I can speed up the booting process, apart from the changes that Bootfix made ? I have tried a freeware utility that removes the standard delay in booting, but apparently this only worked with older versions of the driver software and not 6.5.5.

Thanks in advance,

Kevan Winch

6985. Combo-boxes in GEM

Newsgroup: comp.sys.atari.st.tech
Date: 1994-12-31 17:24:40 UTC
From: cherborth@semprini.waterloo-rdp.on.ca
Message-ID: <H.eg.L5hRZ3MzbZk@semprini.waterloo-rdp.on.ca>
Source record: 28261

I posted this to comp.sys.atari.programmer, and didn't get any responses; I suppose I should just email it to the GEM-list, but I'm at home...

Has anyone got code to handle a CUA-style "combo-box"? I'd be especially interested if someone had implemented it as a GEM++ object...

A combo-box is a object like this:

```
+------------------------+----+
| Text Field | ## | <- button
+------------------------+----+
```

When you click on the button, a list box is presented:

```
+------------------------+----+
| Text Field | ## |
+------------------------+----+
| Item 1 | /\ | <- up-scroller
| Item 2 | ## |
| Item 3 | | <- scroll thing
| Item 4 | ## | <- scroll bar
| Item 5 | ## |
| Item 6 | \/ | <- down-scroller
+------------------------+----+
```

When you select an item from the list, the list box disappears, and the text field is filled in with what you selected.

I was going to start implementing one in GEM++ this week, but if someone's alreay got code to do it, I'd love to see it. I'm considering an approach like this:

The text field is a static text field or a text entry field, it doesn't matter. The button is selectable and exits the dialog. When you click the button, a window pops up, with 7 selectable objects in it, and the only gadets on the window are the vertical scroller objects. As soon as one of the selectable objects is clicked, the window goes away, and the "text field" is replaced by the selection.

Now that I'm thinking about it, the "text object" would just be a GEM OBJECT, and the things in the list box would be GEM OBJECTs too... then you can put _anything_ in the combo-box. (This is all really, really easy to handle with GEM++.)

Any comments?

ICD SCSI Pro -software lets you enter all bad sectors manually, if you
wish. It's great for eg. Micropolis-drives, as you get a list of bad
sectors with them - some of which are not recognized by the software.
v. 6.5.5 should be latest (anybody know any updates coming?).
